01

Before you start

What this system is, who does what in it, and how every screen is laid out.

What Alpha Dental is

Alpha Dental is a complete clinic management system. One place holds your patients, your appointment book, your clinical records, your money, your stock, your staff hours, your marketing, and the messages you send to patients. Nothing is kept on paper and nothing is kept on one person's phone.

It runs in two forms, and both show the same live data:

FORM	WHAT IT IS
The web app	Opens in any browser on a computer, tablet or phone. This is the full system — everything in this manual is here.
The Android app	A native app for phones. It covers the day-to-day screens and receives push notifications. Sign in with email and password .

Your clinic's data is completely separate from every other clinic's. Staff can only ever see the clinic they belong to.

Who does what

Four roles exist. The role decides the shape of a person's access; individual permission switches decide the detail. Part 4 covers this properly.

ROLE	TYPICALLY
Admin	The owner or manager. Sees and can do everything, always.
Dentist	A treating doctor. Appears in the booking list and in dentist reports. Always has the clinical chart and orthodontics.
Receptionist	Front desk. Sees only what the Admin switches on.
Assistant	Chairside or general staff. Sees only what the Admin switches on.

The shape of every screen

Once you are signed in the layout never changes, so it is worth learning once.

- **The sidebar** (left on a computer, a bar along the bottom on a phone) is the main menu: Dashboard, Briefing, Leads, Marketing, Messages, Patients, Appointments, Inventory, Finance, Attendance AI, Reports, Attendance — then **Settings** and **Help** at the foot.
- **You only see the menu items you have permission for.** A short menu is not a fault; it is the permissions doing their job.
- **The notification bell** at the top shows alerts — a doctor calling reception, a lab case in, a new online booking.
- **The chat bubble** in the corner is Alpha, the AI assistant. Part 11.

English and Arabic

The whole system runs in either language, and switching flips the layout to right-to-left where it should. Change it in **Settings** → **Theme** → **Language Settings**. Money is shown in **EGP**.

Signing in

WHERE

The sign-in screen — the first thing you see.

- 1 Type your **email** and **password** and press sign in.
- 2 If your clinic has enabled it, you can sign in with **Google** instead on the web app.
- 3 If you forgot your password, ask your Admin to set a new one for you — **Settings** → **Users** → **the key icon**. There is nothing to wait for in your email.

NEVER SHARE A LOGIN

Everyone needs their own account. The system records who did what against the person signed in, so a shared login makes the activity log, the attendance record and the dentist commission figures meaningless.

02

Getting your clinic started

The once-only steps: create the account, create or join the clinic, and know what your plan includes.

Create your account

WHERE

The sign-in screen → **Create account**

You need an email address and a password of at least 6 characters. No card, no code, nothing else.

- 1 Open the app. You land on the sign-in screen.
- 2 Press **Create account**.
- 3 Type your name, your email, and a password.
- 4 Press **Create account** again to confirm.

Tell the system who you are

Once your account exists you get a screen with two choices. Pick the one that describes you.

"I own the clinic — start a free trial"

Choose this if you are the dentist or the clinic owner. You become the **Admin**.

- 1 Type your clinic's name, for example *Nour Dental Clinic*.
- 2 Press **Create clinic**.

The system builds your clinic and takes you straight to the dashboard.

"I work at a clinic — join an existing one"

Choose this if someone else already set the clinic up.

- 1 Ask your Admin for the **Clinic ID**. They find it under **Settings** → **Users** → **Clinic ID**.
- 2 Paste it into the box.
- 3 Press **Send join request**.

Your Admin approves it under **Settings → Join Requests**. You cannot get in until they do — sign in again once they tell you it is approved.

DO NOT CREATE A SECOND CLINIC

Two clinics do not talk to each other. Patients, appointments and money added to one will never appear in the other. If your colleagues are already using the system, always join with the Clinic ID.

If it says "This is taking longer than usual"

Your clinic was created and is saved. The system is only waiting for your access to switch on.

- Press **Refresh page**.
- Do **not** press *Create clinic* again — that makes a second, empty clinic and you would still be looking at the same waiting screen.
- If refreshing does not get you in after a minute or two, sign out and sign back in.

What your plan includes

Four plans exist. Features that are not in your plan simply do not appear in the menu — that is the usual reason a screen described in this manual is missing for you.

		FREE TRIAL	BASIC	PRO	PREMIUM
Team members (including you)		3	3	10	Unlimited
AI credits per month		200	0	1,000	2,000
AI assistant (the chat bubble)	Yes	—	Yes	Yes	
Inventory	—	—	Yes	Yes	
Staff attendance	—	—	Yes	Yes	
WhatsApp messaging	—	—	—	Yes	
Proactive AI scans (Revenue, Reactivation, Operations)	—	—	—	Yes	
AI summaries built into screens	—	—	—	Yes	
Dictated clinical notes (AI voice)	—	—	—	Yes	
Marketing Studio	Sold separately as an add-on. It is switched on per clinic and is not included in any plan by default.				

UPGRADING LOSES NOTHING

Everything you enter on the free trial stays exactly as it is when you change plan. Your Admin can also be given individual features outside their plan — so if a colleague has a screen you do not, that may be why.

The order to set things up in

Do these once, in this order, and everything afterwards works properly. Each is covered in Part 3.

- 1 **Clinic profile** — name, phone, address, Google links, logo.
- 2 **Prices** — your full treatment list with lab fees and durations. This is the most important one.
- 3 **Schedule** — opening hours, slot length, days off.
- 4 **Your team** — add everyone and set their permissions (Part 4).
- 5 **Everything else** — branches, patient sources, visit reasons, recall, drug list, WhatsApp.

03

Settings — every tab explained

Settings is where the clinic is configured. Nineteen tabs plus a separate Clinic Profile page. Most are Admin-only.

WHERE

Settings in the sidebar. Tabs marked **Admin** below are invisible to everyone else.

Profile

EVERYONE

This is **your own** account, not the clinic's. Your name, your phone, your photo, and a short "about you" — specialties, working hours, anything colleagues should know.

THE TRAP

The tab called **Profile** is you. The clinic's own name, address and logo live on the separate **Clinic Profile** page described at the end of this part. People fill in the wrong one constantly.

Photos must be an image file under 5 MB.

Prices

ADMIN

WHERE

Settings → Prices

This is the most important thing in Settings. Booking reads from it, charges come from it, and dentist commissions and lab fees are calculated off it. Leave it empty and the front desk types prices by hand every single time.

Each treatment shows as a card with its price. Anything needing lab work carries a **LAB** tag with the fee, so you can see at a glance which treatments cost you money before they earn you any.

Adding a treatment

Press **Add Treatment**, then **Save to List**.

FIELD	NOTES
Treatment name	What the front desk picks from the list when booking.
Price (EGP)	The standard price. It can still be changed or discounted on an individual booking.
Typical duration	Optional, but fill it in. It sets the appointment length automatically.
Requires external Lab Work	Tick if a lab is involved.
Estimated lab fee (EGP)	Only appears once you tick lab work. Enter what the lab actually charges you.

THE LAB FEE IS NOT DECORATION

Ticking lab work and entering a fee changes how **every payment for that treatment is split**. Leave it blank on a crown and the clinic silently absorbs the whole lab bill while still paying the dentist commission on the full amount. See Part 7.

TYPICAL DURATION IS WORTH DOING

With it set, booking a root canal blocks 90 minutes instead of the default 30 — so the calendar tells the truth about how full the day is. Leave it blank and every treatment books as 30 minutes, which is how a day that looks half-empty turns out to be overbooked.

Changing a price later does not change anything already charged. Past treatments keep the price they were booked at. Raising your crown price today does not retrospectively raise what last month's patients owe.

Schedule

EVERYONE

WHERE

Settings → Schedule

SETTING	WHAT IT DOES
Opening time	Earliest bookable time.
Closing time	Latest bookable time.
Slot duration	15 / 30 / 45 minutes or 1 hour — the spacing of the times offered when booking.
Days off (weekend)	Tick every day you are closed.

Press **Save Schedule**. The booking screen only offers times **inside** these hours — if reception says a time "isn't in the list", this is why, not a bug.

Days off drive the "*Clinic closed this day*" warning when booking. That warning **asks rather than blocks**, so a deliberate exception is still possible.

SLOT DURATION IS SPACING, NOT LENGTH

A 30-minute slot duration means the times offered are 09:00, 09:30, 10:00. It does not mean every appointment is 30 minutes — the length comes from the treatment's typical duration, or whatever you pick when booking.

Attendance

PRO+

ADMIN

WHERE

Settings → Attendance

This is **geofencing**: it restricts staff clock-ins to the clinic's actual physical location.

- 1 Stand inside the clinic.
- 2 Press **Auto-Capture GPS** — it fills in latitude and longitude for you.
- 3 Set the **allowed radius in metres**.
- 4 Press **Save Geofence**.

GETTING THE RADIUS RIGHT

Too small and staff standing inside your clinic cannot clock in. Too large and they can clock in from the café over the road. Start at **50–100 metres** and adjust. Phone GPS is only accurate to a few tens of metres indoors, so a radius that looks generous on a map is usually about right. If staff report clock-in failing at reception, raise the radius first.

Branches & Rooms

ADMIN

If your clinic has more than one location, add each **branch** here with its address. Add your **rooms / chairs** too. Once branches exist, a branch selector appears when booking, on lead cards, and on the public booking page. Both lists reject duplicate names.

Recall

ADMIN

WHERE

Settings → Recall

Two numbers, both in months, that decide who the system considers due and who it considers lost.

SETTING	WHAT IT DRIVES
Recall interval	After this long since their last visit, a patient appears on the recall list — the "due for a check-up" list in AI Operations.
Reactivation threshold	Used by the reactivation scan to decide who counts as <i>lapsed</i> .

Prescriptions

EVERYONE

Your **drug database** — shortcuts for writing prescriptions. Each saved drug carries its dose and frequency, so picking it fills those in automatically. Press **Save Shortcut** to add one.

BUILD THIS LIST

Hand-typed drug names drift. The same antibiotic spelled three ways cannot be searched, counted, or checked against a patient's allergies later.

Users · Join Requests

ADMIN

Your team, their roles and their permissions — and the Clinic ID people join with. This is large enough to have its own part: see **Part 4**.

Activity Logs

ADMIN

Every user action with a date and time. Filter by **module**, by **severity**, or search by user or action. Each entry is marked **Done manually** or **Done by Alpha AI**, so you can always tell a human action from an automated one.

This is where to look when a record changed and nobody remembers changing it.

AI Credits

ADMIN

Your monthly AI allowance, how much is left, and a **breakdown by feature** — AI Assistant chat, Reception assistant, Diagnosis discussion, Treatment plan suggestions, Plan translation, Marketing content.

Credits reset on the 1st of every month. Unused credits do not roll over.

Alerts

ADMIN

Precise routing for system alerts and messaging:

- **In-App Clinical Alerts** — push notifications visible to doctors and front desk.
- **Lab Cases Received** — alert when a lab case comes back.
- **Email Reports** — periodic reports by email.

Press **Save Alert Preferences**.

WhatsApp

PREMIUM

ADMIN

The connection, the sending mode, the message templates, and the owner alerts. Covered fully in **Part 10**.

SMS

ADMIN

Sending clinic messages as plain text messages from a paired Android phone, for patients with no WhatsApp. Covered fully in **Part 10**.

Theme

EVERYONE

Interface Color Palette and **Language Settings** — one button switches the entire system between English and Arabic, including the right-to-left layout.

Interface

EVERYONE

How two busy screens behave. Personal preference; change it if the current shape annoys you.

SETTING	CHOICES
Appointment Booking Mode	Pop-up Modal or Side Drawer — how the booking and editing form opens.
Selected Appointment Panel	Details Editor (the fields, ledger and payment button) or Reception Assistant .
Clinical Editor Mode	How the clinical procedure editor opens.

Online Booking

ADMIN

Switches on your public booking page and gives you the link to share. You can upload a cover image (under 5 MB) and copy the link to the clipboard. Covered in **Part 9**.

Patient Sources

ADMIN

The list of answers to "how did you hear about us?" — Social Media, Friend / Family, Online Booking, Other Doctor, and whatever you add. These appear on patient files and drive the **Patient Sources** report. Duplicates are rejected.

Visit Reasons

ADMIN

The list offered as **Primary reason for visit** when booking: Pain, Check-up, Cleaning, Follow-up, Broken tooth, Cosmetic consultation, Emergency, and any you add.

Clinic Profile — a separate page

ADMIN

WHERE

Settings → Clinic Management → Clinic Profile

FIELD	WHAT IT IS FOR	REQUIRED
Clinic name	The name of the clinic itself.	Yes
Clinic phone	Your reception number.	No
Address	Where the clinic is. Prints on prescriptions.	No
Google Maps URL	A link that opens <i>directions</i> to you.	No
Google review link	A link that opens Google's <i>write a review</i> form.	No
Logo	PNG or JPG.	No

THE TWO GOOGLE LINKS ARE DIFFERENT

Maps URL is for directions — open your clinic on Google Maps, press Share, copy the link. **Review link** opens the review form and usually looks like <https://g.page/r/...>, from your Google Business Profile. It is the one inserted into the WhatsApp message asking a patient to rate you, wherever you put `{{google_link}}`. Paste a Maps link into the review box and patients get directions instead of a review form.

The logo

- 1 Press **Choose file** in the Logo box.
- 2 Pick a PNG or JPG. A preview appears straight away.
- 3 Press **Save**. The file uploads on save, not when you pick it — leave the page without saving and nothing is stored.

WHAT THE LOGO DOES TODAY

It is saved against your clinic and shows in the preview box, but it does not yet appear on printed receipts or prescriptions. Upload it now so it is ready; do not expect it on your printouts yet.

If saving fails: *Upload failed* — try a smaller file or a different PNG/JPG. *Images only* — PDFs and documents are not accepted. *Sign in required* — your session ended; sign in again and re-enter your changes.

04

Your team, roles and permissions

Getting staff into the system, and deciding exactly what each of them can see and do.

WHERE

Settings → **Users** · Admins only

Everyone who uses the system needs their own login. There are two ways in, and both end at the same place.

Way 1 — you create the account for them

Best when the person is sitting with you, or you are setting up before anyone starts.

- 1 Go to **Settings** → **Users**.
- 2 Press **Add Team Member**.
- 3 Fill in **Name**, **Email** (what they sign in with), **Password** (at least 6 characters), and **Role**.
- 4 If the person is an Admin who also treats patients, switch on **Also works as dentist**.
- 5 Save.

They can sign in immediately with that email and password.

Way 2 — they sign up and ask to join

You do this

- 1 Go to **Settings** → **Users**.
- 2 Find the **Clinic ID** box and press **Copy**.
- 3 Send that ID to your colleague. WhatsApp is fine — it is not a password.

They do this

- 1 Create their own account on the sign-in screen.
- 2 Choose **I work at a clinic — join an existing one**.
- 3 Paste the Clinic ID and press **Send join request**.

Then you do this

- 1 Go to **Settings** → **Join Requests**.
- 2 You see a card with their name, email and the date they asked.
- 3 Press **Approve**, or **Reject** to turn them down.

APPROVING IS ONLY HALF THE JOB

Everyone approved this way is added as an **Assistant with no permissions**, whatever job they actually do. They will sign in and find almost nothing. Go straight to **Settings** → **Users** → **Manage Access** and set their real role and permissions.

Layer 1 — the role

WHERE

Settings → **Users** → **Manage Access** on the person's card. A panel slides in from the side.

ROLE	WHAT IT MEANS
Admin	Full access to everything, always.
Dentist	A treating dentist. Appears in appointment lists and dentist reports. Can always open the clinical chart and orthodontics.
Receptionist	Front desk. Sees only what you switch on.
Assistant	Chairside or general staff. Sees only what you switch on.

ADMIN IGNORES EVERY PERMISSION SWITCH

Set someone to Admin and all the switches below stop mattering — they can see and do everything, including money, settings and deleting records. Only give Admin to people who should run the whole clinic.

"Also acts as Dentist"

This toggle appears **only when the role is Admin**. Switch it on when the owner also treats patients — they will then show up in the dentist list when booking, and in the per-dentist reports. Moving someone away from Admin turns it off automatically.

Layer 2 — the 26 permission switches

The count on each person's card — for example *8 of 26* — tells you how many are on.

THE RULE THAT EXPLAINS ALL OF IT

"Module access" switches open a page. Without one, the page is not in their menu at all. **"Action" switches decide what they can do once inside.** You almost always need both — turning on *Add patients* without *Patients* gives someone permission to add a patient with no way to reach the screen.

Module access — opens the page

SWITCH	OPENS
Patients	The patient list and patient files
Appointments / calendar	The appointment calendar
Lab tracking	Lab case tracking
Finance / ledger	The money ledger
Inventory	Stock
Reports	The reports section
Settings (full page)	The settings page
Clinical chart	The clinical chart inside a patient's file
Orthodontic module	Orthodontic cases

Dentists get the clinical chart and orthodontics from their role. You only need those two switches to give a **non**-dentist access — an assistant who writes up notes, for example.

Actions — what they can do inside

GROUP	SWITCHES
Patients	Add · Edit · Delete
Appointments	Book/create · Edit/reschedule · Delete
Finance	Add transactions · Edit · Delete
Inventory	Add items · Edit · Delete
Clinical chart	Edit notes · Delete notes
Reports	Export / download
Attendance	Attendance admin — see the whole team's attendance

Every member of staff can open Attendance to check themselves in. The *Attendance admin* switch is what lets someone see everyone else's.

The Settings switch that catches everyone

There are two, and they do different things:

- **Settings link (sidebar)** — puts the Settings icon in the menu.
- **Settings (full page)** — actually lets them open it.

Give someone only one and they either see a link that rejects them, or have access to a page with no way to reach it. **Turn on both, or neither.**

Doing it quickly

- Use the **search box** at the top of the panel to find a switch by name instead of scrolling.
- Each group has **Select All** / **Deselect All** — the fastest way to give someone a whole area.
- **Every change saves the moment you flick it.** There is no Save button and no way to cancel — flick it back if you change your mind.
- Changes normally reach the person straight away. If they are already signed in and nothing changed, ask them to refresh.

Suggested starting points

ROLE	SWITCH ON
Receptionist	Patients · Add patients · Edit patients · Appointments · Book appointments · Edit appointments · Finance · Add transactions
Dentist	Patients · Appointments · Reports <i>(the clinical chart and orthodontics come with the role)</i>
Assistant	Patients · Appointments · Inventory · Add inventory · Edit inventory

Notice that no starting point includes **Delete**. Deletion is worth granting deliberately, one person at a time, after they have settled in.

Things you will run into

"Staff Limit Reached"

Your plan sets how many people you can have — 3 on the free trial and Basic, 10 on Pro, unlimited on Premium. At the limit, **Approve** stops working and a red warning appears. Upgrade, or remove someone who has left.

Changing someone's password

- 1 On their card, press the **key** icon.
- 2 Type a new password of at least 6 characters.
- 3 Press **Force Update System**.

Tell them the new password and ask them to change it. The action is recorded in the activity log.

Removing someone

Press the **bin** icon on their card and confirm. This removes their login and their staff record. **You cannot delete yourself** — the bin does not appear on your own card, which stops a clinic losing its last Admin.

A card marked "Broken Profile" in red

Their login exists but their staff record is missing, so the system cannot tell what they are allowed to do. It usually happens when an account was half-created. The fix is to **delete the card and add the person again** using Way 1. Their email can be reused.

"It says 0 of 26, but they can already see Patients and Appointments"

Anyone added with **Add Team Member** starts with a small set of built-in permissions covering Patients and Appointments. Those are not shown as switches, so the counter reads 0 while the menu clearly shows two items. Nothing is wrong.

"I turned on everything and they still cannot see the AI pages"

Three pages have **no switch at all** and are Admin-only no matter what you do: **Briefing, Leads**, and the **AI Attendance** page. If a member of staff needs one, the only way today is to make them an Admin — which gives them everything else too. Think carefully before doing that for a receptionist.

Dashboard and Attendance are open to every member of staff automatically.

05

The front desk

The dashboard, the patient list, booking, and running the day from arrival to check-out.

The dashboard

WHERE

The screen you land on. **Dashboard** in the sidebar.

Built to answer one question in three seconds: **what is happening in the clinic right now?**

The numbers along the top

WHAT IT COUNTS

Daily Income	Money received today.
Appointments	How many are booked today.
Appointments Status	Today's split — Confirmed, Unconfirmed, Completed.

DAILY INCOME IS CASH, NOT WORK DONE

A patient who had a 5,000 crown fitted today but has not paid adds nothing to it. A patient settling an old bill adds their payment. See Part 7.

Under the status split is a plain-language read of how the day is going — "*Flow is smooth & steady*" and similar.

Today's schedule

The middle of the screen is the day, hour by hour: patient, phone, treatment, dentist, duration. Each appointment carries a one-click button for its next step — **Arrive, Seat, Check Out** — and the waiting-mood tag sits beside the patient's name. **Day / Week** switches the range and **View All** opens the full calendar.

The rest of the dashboard

- **Attendance nudge** — if you have not clocked in, a pink band says so with a **Clock In** button. Nothing stops you working without clocking in, but the hours will not be recorded.
- **New Patient** and **Quick Pay** at the top right — between them they cover most of a receptionist's day without navigating anywhere.

- **Print Rx** — above the schedule. Prints a prescription for a patient you pick; the shortcut for when someone comes back to collect one.

The dashboard is deliberately about **today**. Trends and per-dentist performance live in Reports; totals across a period live in Finance.

Add a new patient

WHERE

New Patient — on the dashboard, and at the top of the **Patients** screen.

Only two things are required. Everything else can wait.

FIELD	REQUIRED	NOTES
Patient name	Yes	
Phone	Yes	Pick the country first, then type the number without the leading zero .
Address	No	
Date of birth	No	Worth getting — it drives age in reports.
Gender	No	
How they heard about you	No	Feeds the Patient Sources report.
Allergies	No	Shown in red for a reason — see below.
Medical history	No	Diabetes, hypertension, anything the dentist should know.

The phone number

The country selector sits beside the phone box, set to **Egypt (+20)** by default. Type the rest of the number without the leading zero — `1001234567`, not `01001234567`. If you get *"Phone must include country code first"*, check you picked a country and left off the leading zero.

THIS MATTERS MORE THAN IT LOOKS

Every WhatsApp reminder, booking confirmation and payment message goes to this number in exactly this format. A wrongly-typed number means that patient silently never hears from you again.

When the phone number already exists

An amber warning appears naming who already has it and their file number. This is normal in family clinics. To go ahead, tick *"Yes, create a separate profile with this shared number (e.g., family member)"* and save. **Without ticking it the save will not go through.**

Only override it when you mean to. If it is actually the same person coming back, close the form and search for their existing file — two files for one person means their money and treatment history end up split across

both.

The file number and the allergies box

You do not type a file number. The system assigns the next one automatically — **PT-1001, PT-1002** — and no two patients can ever get the same one.

Fill in **allergies** if you asked, and leave it **empty** if you did not. An empty box honestly means "not asked". Typing "none" when nobody actually asked is worse than leaving it blank.

The patient list

WHERE

Patients in the sidebar.

Search by **name or phone**. The list loads in pages — press **Load More Patients** for older files. Click any patient to open their file (Part 6).

Book an appointment

WHERE

Appointments → **Add Appointment**

The booking form opens as a panel down the left with the calendar still visible beside it, so you can see what is already booked while you choose a time. (Prefer a pop-up? Change it in **Settings** → **Interface**.)

Step 1 — find the patient

Type a **name or phone number**. Matching patients appear underneath with their file number; click the right one and it locks in. If nobody comes up, tick **New Patient** at the top of the panel to create one without leaving the booking.

Step 2 — add the treatment

Press **Add Procedure**, then **Confirm Procedure** to attach it.

FIELD	WHAT IT DOES
Primary reason for visit	Pain, Check-up, Cleaning, Follow-up, Broken tooth, Cosmetic consultation, Emergency — the list you set in Settings.
Service	Pick from your price list. The cost fills in automatically.
Cost	Fills from the service; type over it if this case is priced differently.
Add to Ledger	The switch that decides whether the patient gets charged.

ABOUT "ADD TO LEDGER"

It is ticked by default, which is right most of the time. **Untick it when the visit should not cost anything** — a review after a root canal, a fitting appointment in a course already paid for, an adjustment. The appointment is still recorded and the dentist still sees it, but nothing is added to what the patient owes.

Get it right in both directions. Left ticked on a free follow-up, the patient is charged twice for one job. Unticked on real new work, the treatment is never billed — and nobody notices until you are chasing a balance that was never raised.

Step 3 — when, who, how long

FIELD	NOTES
Date	
Time	The dropdown only offers times inside your clinic hours.
Dentist	Only staff marked as dentists appear. If it is empty, nobody is set up as one yet.
Duration	Defaults to 30 minutes, or the treatment's typical duration.
Appointment stage	Starts at Unconfirmed . Set it to Confirmed straight away if the patient is on the phone agreeing to it.

Step 4 — confirm booking

Press **Confirm Booking**. Two things can interrupt, and both **ask rather than block**:

- **"Clinic closed this day"** — that date is a day off in your schedule.
- **"This slot conflicts with another appointment. Continue?"** — that dentist is already booked then. Sometimes intentional, usually a mis-click.

Press **Add Procedure** again to attach another treatment. Each gets its own service, cost, and its own **Add to Ledger** choice — so one visit can correctly contain one billable procedure and one free follow-up.

The calendar and its four views

WHERE

Appointments

VIEW	SHOWS
Week	The whole week as a grid. Days off are left out automatically. The default.
Day	One day, hour by hour.
Doctors	One day with a column per dentist — the view for seeing who is free.
List	A plain grouped list rather than a grid.

Filter by **dentist** and, if you have them, by **branch**. **Add Patient** sits beside **Add Appointment** so a walk-in can be created without leaving the calendar.

Running the day — the stages

Every appointment carries a **stage**. Keeping stages honest through the day is what makes the dashboard, the waiting-room list and the reports mean anything.

STAGE	WHAT IT MEANS
Unconfirmed	Booked, but the patient has not confirmed.
Confirmed	They have said they are coming.
Check in	They have arrived and are in the waiting room.
In chair	They are being treated.
Check out	Treatment finished, settling up.
Completed	Done and paid.
Delayed	Running late, still expected.
No show	Did not come and did not say.
Canceled	Called it off.

A normal visit runs **Unconfirmed** → **Confirmed** → **Check in** → **In chair** → **Check out** → **Completed**.

Click any appointment to open it and pick a new stage under **Status**. The dashboard's one-click **Arrive / Seat / Check Out** buttons do the same thing without opening anything — the fast path when the waiting room is full.

WHY "CHECK IN" MATTERS MORE THAN THE OTHERS

It is the moment the system starts counting how long the patient has been waiting, and what puts them on the waiting-room list. Skip it — jumping from Confirmed straight to Completed — and you lose your waiting-time figures for that patient entirely. That number is the one your patients notice most.

Waiting mood

Once someone is checked in you can tag how they are doing: **Happy**, **Neutral**, **Anxious** or **In Pain**. One tap, and it changes how the room is run — someone marked *In Pain* who has waited forty minutes is a problem worth seeing before they complain, not after.

No show vs Canceled

- **Canceled** — they told you. Rebook them.
- **No show** — they did not. That is the number to watch; a patient who no-shows twice will probably do it again.

Marking every missed appointment as *Canceled* to be polite makes your no-show rate look perfect and hides a real problem.

Move or cancel an appointment

Moving

- 1 Click the appointment in the calendar.
- 2 Press **Edit**.
- 3 Change the date, time, dentist or duration.
- 4 Save.

The same two warnings from booking apply, and again they ask rather than block.

Cancelling

Open the appointment and set its **Status** to **Canceled**. A cancelled appointment stays in the record: you can see it happened, who cancelled and when. That history is what tells you a particular patient cancels every other visit.

Cancelling tells the patient

If WhatsApp is set up, three messages go out automatically with nothing to press:

WHEN	MESSAGE
Booking made	Confirmation with the date and time.
Booking changed	The new date and time.
Booking cancelled	Told it is off.

CANCEL VS DELETE — THE DIFFERENCE THAT MATTERS

Cancel — the appointment stays, marked cancelled. The patient is told. It shows in reports.

Delete — the appointment is removed. No message goes out. No trace it ever existed.

Cancel is almost always right. Delete is for genuine mistakes: a double booking, a test entry, a patient booked into the wrong file. Deleting an appointment the patient was expecting means they turn up to a clinic with no record of them.

If the patient simply does not come, do not cancel it after the fact — mark it **No show**.

Calling reception from the chair

A dentist mid-treatment can **Call reception** — tap a receptionist's name and their screen takes over with "Doctor is calling you" and a sound. They press **Seen** to clear it and carry on.

If nothing happens, that staff member has no login linked to their record.

The notification bell

Top of the screen. Alerts arrive here and, if push notifications are on, on phones too: a doctor calling, a lab case received, a new online booking request, clinical alerts. Configure what is sent in **Settings** → **Alerts**.

06

The patient file & clinical work

Eight tabs, three quick actions, and everything a dentist reaches for during an appointment.

How the file is laid out

WHERE

Patients → click any patient. Or click their name anywhere they appear.

TAB	WHAT IS IN IT
Clinical	The treatment timeline — every procedure they have had. Needs clinical-chart access.
Treatment Plan	Multi-visit plans, with AI suggestions and a patient-facing PDF.
Finance	Charges, payments, balance, receipts.
Timeline	Visit history.
Overview	Summary of the patient, their details and preferences.
X-Rays & Photos	Images and radiographs.
Prescriptions	Prescriptions written, and medications on file.
Notes	Free notes about the patient.

The **Quick Actions** row jumps to the three things a dentist reaches for mid-appointment: **Write Rx**, **Diagnosis**, **Ortho**. There is also **New booking**, **Edit Profile**, **Lab Order** and **Google review**.

THE MEDICAL ALERT

If the patient has allergies or a medical history recorded, a pink **Medical Alert** band sits across the top of their file — above everything else, in every tab. That is why the allergies box matters when you create a patient. Filled in, it warns every dentist who ever opens the file. Left empty, nobody gets warned.

The clinical record

WHERE

Patient file → **Clinical** tab

Each entry gives you the **procedure**, its **status**, the **tooth**, the **dentist** and the **cost**. Sorted newest first; the sort control flips it to oldest first when you want to read a course of treatment forwards. You can also drag rows into a manual order.

Adding a procedure

Press **Add New Procedure**. Most of the time you do not need to — booking an appointment with a treatment already creates the clinical entry and the charge together. Use this when work was done that never had an appointment: something added mid-visit, or a walk-in treated on the spot.

A CLINICAL ENTRY IS NOT A CHARGE

A procedure added here still needs to reach the ledger to be billed. Work recorded clinically but never billed is invisible money — the patient walks out owing nothing on a treatment they actually had. Check the Finance tab afterwards and make sure the charge is there. (The AI Revenue Recovery scan in Part 11 finds exactly this.)

Continuing work across visits

A procedure that is not finished in one sitting can be marked **Continue in another appointment**, so the same piece of work carries forward instead of being logged twice.

Editing and deleting

Each row has an edit and a delete action. Editing is right for a wrong tooth number, a wrong cost, or a procedure logged against the wrong dentist.

DELETING A CLINICAL RECORD IS DIFFERENT

It is a medical record — it says what was done to a person's body. Delete it only when it is genuinely wrong: logged on the wrong patient, or entered twice. If the treatment happened, it stays, even if the details need correcting. Deleting also removes any linked finance rows.

Both are separate permissions, and neither comes with the Dentist role automatically.

The teeth chart (odontogram)

WHERE

Patient file → **Diagnosis** in Quick Actions. The page is titled **Dental Diagnoses**.

This is where findings get recorded against individual teeth, rather than as a paragraph of notes nobody can search later.

Adult and child

The **Adult / Child** toggle switches the chart between the permanent dentition and the primary one. **Get this right before you start charting a child** — the tooth numbers are different, and findings recorded against adult numbers on a six-year-old will not mean what you want them to mean.

Teeth are numbered **FDI**: 18–11 and 21–28 across the top, 48–41 and 31–38 across the bottom, with **RIGHT** and **LEFT** marked so there is no ambiguity about whose left.

Charting a finding

Tap a tooth to begin, then pick what you found. The categories are colour-coded and sit under the chart:

Dental Caries	Pulpal Status	Periapical Status
Hypersensitivity	Tooth Wear / NCCL	Traumatic Injuries
Periodontal	Developmental	Restoration / Prosthesis
Surgical / Extracted		

Each finding appears in the **Diagnoses Log** on the right, and the **Affected Teeth** counter goes up.

Clinical and Perio

Two views of the same mouth, toggled above the chart. **Clinical** is the findings above; **Perio** is periodontal charting — pocket depths and the rest, entered tooth by tooth.

Finding something later, and saving

The Diagnoses Log has a search box — **by tooth, status or notes**. This is the whole reason for charting on teeth rather than writing prose: six months later you can ask "what did we find on 26?" and get an answer in a second.

The chart saves as you go. **All Saved** at the top is the confirmation — if it says anything else, wait before closing the page.

PDF report produces a diagnosis report — for the patient, for the file, or to send to a specialist you are referring to.

Treatment plans

WHERE

Patient file → **Treatment Plan** tab

A plan is a course of treatment broken into visits, each step with a procedure name, an estimated cost and estimated minutes.

- 1 Press to create a plan and give it a short explanation for the patient.
 - 2 Press **Add visit** for each stage, filling in the procedure and how long it should take.
 - 3 Press **AI Suggest** if you want the assistant to draft the steps from what is already charted — you can then edit anything it proposes.
 - 4 Save. Change its status as the plan progresses.
- **Download PDF** gives the patient a written plan to take away.
 - The plan can be **translated** for a patient who reads the other language.
 - **Free slots** are read from the calendar so visits can be scheduled straight from the plan.

- **AI Diagnosis Discussion** — a conversation with the assistant about this specific patient's findings. Each discussion is saved and can be reopened or deleted.

Both AI features cost credits from your monthly allowance.

Writing a prescription

WHERE

Patient file → **Write Rx** in Quick Actions. The page is called **Prescription Studio**.

The right-hand side shows the prescription exactly as it will print — your clinic name, address and phone across the top, taken from your clinic profile. If that header is wrong, fix it in **Settings** → **Clinic Profile**, not here; it is the same header on every prescription you ever write.

- 1 Pick the **Attending Doctor**. Only staff marked as dentists appear. **Diagnosis / CC** is optional.
- 2 Add the medication — either **Select from database** (dose and frequency come with it) or **Manual entry** (drug name, dose / frequency, and optional special instructions).
- 3 Press **Add to Prescription**. The counter shows how many are on it and the preview updates. Repeat for each drug.
- 4 Finish with one of the three buttons at the top.

BUTTON	WHAT IT DOES
Save	Files it against the patient — it appears in their Prescriptions tab.
Print	Prints it.
WhatsApp	Sends the PDF to the patient's number.

SAVE IT EVEN WHEN YOU PRINT OR SEND

Printing hands over paper; saving is what puts it in the record, so anyone opening the file later can see what this patient was given and when. That matters if they come back with a reaction, or ask for the same thing again.

ALLERGIES ARE STILL YOUR CHECK

The pink Medical Alert band lists them, but nothing on this page stops you prescribing something the patient is allergic to.

Old prescriptions can be reopened, re-sent, printed again or deleted from the **Prescriptions** tab. There is also a **Print Rx** shortcut on the dashboard for a patient collecting one later.

X-rays and photos

WHERE

Patient file → **X-Rays & Photos** tab

Upload radiographs and clinical photos against the patient. Click any image for a full-size preview. Images can be deleted. Only image files are accepted.

Orthodontics

WHERE

Ortho — from a patient's Quick Actions, or the orthodontics list.

The list shows **Total cases**, **Active cases** and **Started this month**, and can be searched by patient name or phone.

Starting a case

- 1 Open the patient and press **Ortho**, then **Start Orthodontic Treatment**.
- 2 Write the **diagnosis and orthodontic master plan** — the box asks for exactly that.
- 3 Save. The case is now active and appears in the active list.

Recording each visit

Add a visit record describing the orthodontic work done, plus a **plan for the next visit**. Visits can be edited or deleted.

Finishing and reopening

- **Mark complete** — the case moves out of the active list. You are asked to confirm.
- **Restore Case** — reactivates a completed case if treatment resumes.
- **Open in WhatsApp** — message the patient from the case.
- **Return to clinical profile** — back to the main file.

Patient preferences and removal

Opting out of automated messages

On the patient's file you can switch on **Opt-out of automated WhatsApp messages** (and the same for text messages). From then on the patient receives no automatic reminders or campaigns. Switch it back off and they can receive them again. Respect this — it is also what the Recover Payments list means when it marks someone *Opted out of messages*.

Deleting a patient

Delete patient permanently removes the file. This is a separate permission and is not something to do casually — the clinical and financial history goes with it. Correct a wrong file rather than deleting it wherever you can.

Money

Taking payments, a patient's account, how a payment is split, the clinic ledger, and chasing what you are owed.

Take a payment — Quick Pay

WHERE

Quick Pay on the dashboard. The screen is titled **Receive Payment**.

Step 1 — find the patient

Search by **name or phone number**. The system reads their account and lists everything they still owe.

Step 2 — choose what they are paying

Two choices, and they behave differently.

Paying a specific bill

Under **Outstanding Procedures** you see each unpaid treatment with **Owes:** and the remaining amount. Pick the one they are settling. You then get three numbers:

Total Cost	What the treatment costs.
Paid So Far	What has already been paid against it.
Amount Paying Now	What you are taking today.

You cannot enter more than the remaining balance. Try it and you get "*Payment amount cannot exceed the remaining balance*". That is deliberate — it stops a treatment showing as overpaid.

General Payment

Puts money on the patient's account without tying it to any one treatment — described in the app as *Add advance credit*. Use it for a deposit up front, or a round sum against whatever they owe.

PREFER PAYING A SPECIFIC BILL

A general payment reduces the balance but does not tell you *which* treatment got settled — so later, when you are working out what is still outstanding on a particular crown, the trail is muddier.

Step 3 — confirm

Press **Confirm Payment**. That is the moment the money becomes real: it appears in the day's takings on the dashboard, in the ledger, and against the patient's account. If the treatment had a dentist commission or a lab fee, both are worked out now.

WHY THE PAYMENT IS ITS OWN RECORD

The charge and the payment are two separate entries. The treatment creates the charge; taking money creates a payment; the balance is the difference. That is why you cannot "mark a treatment as paid" — you record the payment and the balance follows. It also means a patient paying in three instalments has three payment records, and you can see exactly when each one arrived.

A patient's account

WHERE

Patient file → **Finance** tab

WHAT IT MEANS

Total Treatment	Everything ever charged to this patient.
Total Paid	Everything they have ever paid.
Balance Due	The difference — what they owe right now.

Zero means they are square. A negative balance means they have paid ahead and have credit sitting on the account.

Below the totals, every line on the account in date order — date, description, type, cost, paid. Charges and payments sit in the same list, which is what makes it readable: you can follow a crown charged at 5,000, then a 2,000 payment, then 3,000 later, and watch the balance close.

Adding a payment from here

Press **Add Payment** (the form is headed **Receive Payment**).

- **Link to Procedure** — attach it to a specific treatment, or leave it as **General Payment**.
- **Description / Notes** — optional, but worth using for anything unusual: "*paid by her brother*", "*deposit for whitening*".
- **Amount (EGP)**, then **Confirm**.

This does the same job as Quick Pay. Use whichever you are nearer to.

Giving the patient a receipt

Two buttons above the transaction history:

- **Download PDF receipt** — builds a PDF of the account and downloads it. It takes a moment; the button shows *Generating...* while it works.

- **Send Receipt on WhatsApp** — sends the same receipt straight to the patient's number, nothing to print or hand over.

WhatsApp sending needs WhatsApp set up, and it goes to the number on the patient's file — the practical reason the phone number has to be right when you create them.

Fixing a mistake

Each line has an edit action. You can correct a wrong amount, a wrong description, or a payment attached to the wrong treatment.

CORRECT RATHER THAN DELETE

A corrected line still shows the money moved; a deleted one leaves a hole nobody can explain three months later when the totals do not match. Editing and deleting money records are separate permissions — a receptionist who can take payments cannot necessarily undo them, which is usually how you want it.

How a payment is split: lab, dentist, clinic

When a patient pays, that money does not all belong to the clinic. The system works the split out at the moment the payment is taken.

The order things come out

Lab fee first, then the dentist's percentage, and the clinic keeps the rest. The dentist's commission is calculated on what is left *after* the lab is paid — not on the full amount the patient handed over.

Worked through with a 5,000 crown, an 1,800 lab fee, and a dentist on 30%:

Patient pays	5,000
Less lab fee	-1,800
Net	3,200
Dentist's 30% of the net	-960
Clinic keeps	2,240

If the commission were taken on the full 5,000, the dentist would get 1,500 and the clinic 1,700 — the clinic absorbing the entire lab bill on its own side. Taking the lab off the top first is what splits that cost fairly between them.

The rule that surprises people

The lab fee comes off the first payment only. When a patient pays in instalments, the lab fee is deducted once — from the earliest payment against that treatment. Every later instalment is split between dentist and clinic with no further lab deduction.

Same crown, paid in two halves of 2,500:

	FIRST PAYMENT	SECOND PAYMENT
Paid	2,500	2,500
Lab fee	-1,800	0
Net	700	2,500
Dentist 30%	210	750
Clinic	490	1,750

The dentist earns **less on the first instalment and more on the second**. That is correct — the lab is only paid once — but it looks wrong to a dentist checking their own numbers mid-treatment. Worth explaining before they ask.

When the payment is smaller than the lab fee

If a patient pays 1,000 against a crown with an 1,800 lab fee, the net is negative and **the dentist earns no commission on that payment** — there is nothing left after the lab. They earn on the following instalments instead. Nothing is lost; it is deferred.

Where the numbers come from

- **Lab fee** — set on the service in your price list (*Requires lab* and *Estimated lab fee*).
- **Commission percentage** — set per dentist.

Both are read at the moment the payment is recorded. Changing a service's lab fee later does **not** retrospectively change payments already taken.

The split is visible in the **Doctor Commission Breakdown** on the Finance page and in the exported report.

The clinic ledger

WHERE

Finance in the sidebar.

True Net — the headline

The big number is **True Net**: what the clinic actually keeps, after doctor and lab deductions and recorded expenses. Not what came through the till. It is built from four lines, also shown as cards across the top:

LINE	WHAT IT IS
Cash in	Payments actually received.
Discounts	Given away on procedures.
Commissions + lab	The dentists' share and the lab's, taken out of cash in.
Expenses	Anything you have recorded as going out.

LOOK AT TRUE NET, NOT CASH IN

A day with 20,000 through the till and 14,000 of lab bills and commission is a very different day from 20,000 with none — and only True Net tells them apart.

Cash in counts money, not work

A 5,000 crown fitted today but not paid for adds nothing. A patient settling a bill from three months ago adds 5,000 today. So a busy month can look quiet, and a quiet month can look excellent, purely from when patients happened to pay. If you want to know how much *work* you did, that is Reports.

The period and the transaction list

Daily · Monthly · Range, with a date picker beside them. Daily opens on today.

Every movement in the period is listed with **Date, Details, Patient, Allocations and Amount** — income in green, expenses in red. Narrow it with **All / Income / Expense**, by **Doctor** (one dentist's takings only), or **search** by patient or note.

Recording an expense

Press **Manual Entry**. This is where rent, salaries, materials and lab bills go in — anything the clinic pays out that is not already tracked.

BE CONSISTENT WITH NAMES

Always "Lab", never sometimes "Laboratory" and sometimes "lab fees". That consistency is the difference between a breakdown you can read and a list you cannot.

Exporting

PDF Report produces a formatted report — the totals, an income-versus-expenses comparison, both transaction tables, and a doctor commission breakdown. Suitable for handing to an accountant. Exporting is its own permission: someone can view Finance without being able to download it.

Recover Payments — who owes you

WHERE

Finance → **Recovery**. Titled **Recover Payments**.

Every patient who owes the clinic money, with their phone number, **largest first**. This is the collections worklist.

GROUPING	WHAT IT MEANS
Billed, not paid	An invoice exists and part or all of it is unpaid.
Treated, never invoiced	Work is in the clinical record with no charge raised at all. This is money you did not know you were missing.

Sort by **Largest amount**, **Oldest debt** or **Last activity**, and search by name or phone.

Working the list

Each patient can be marked as you go, so the next person picking it up knows where things stand:

- **Not contacted yet** — the starting state.
- **Promised to pay** — record the follow-up.
- **Written off** — stop chasing it.

Cards also flag **No phone number on file** and **Opted out of messages**, so you do not waste time or breach a patient's preference.

When there is genuinely nothing outstanding the page says so: *"Nothing outstanding. Everything is collected."*

Running the clinic

Stock, staff hours, and the five reports that tell you how the business is actually doing.

Inventory

PRO+

WHERE

Inventory in the sidebar. Not on the free trial or Basic — if it is not in your menu, that is why.

The figures at the top

	WHAT IT IS
Total Value	Estimated worth of everything on the shelf.
Total Items	How many items match your current filters.
Low Stock	How many have dropped below their reorder threshold.
Purchased / Consumed	Quantity and value moved in the selected period.

Low Stock is the one to look at. It is the number that stops you discovering you are out of composite halfway through a filling.

Adding an item

Press **Add Item**. Each item takes a **Name**, a **Category** and optional sub-category, current **Stock**, a **Reorder threshold**, a **Cost per unit**, and a **Unit** — syringe, box, carpule, pack, whatever you actually count in.

THE REORDER THRESHOLD IS REQUIRED, AND MUST BE ABOVE ZERO

The form will not save without one. An item with a threshold of zero can never trigger a low-stock warning, and a silent zero is impossible to tell apart from a deliberate one. Set it to however many you need to still have when you place an order — enough to cover the days between ordering and delivery, not your last one.

Filtering, adjusting, exporting

- **All / Low / OK** across the top, plus category and sub-category filters and a reset. **Low** is your shopping list — open it before you phone the supplier and you have written the order.
- Quantities can be adjusted directly as you use things or take a delivery. The purchased and consumed figures follow.
- **CSV** downloads the list as currently filtered — for a stock take, or to send to a supplier.

INVENTORY IS ONLY AS GOOD AS THE HABIT

Counted at the start and then never adjusted, it drifts into fiction within a month — and a low-stock warning nobody trusts is worse than none.

Staff attendance

PRO+

WHERE

Attendance in the sidebar. The page is called **My Worksheet**.

Every member of staff can open it — it is one of only two screens that need no permission at all, because everyone has to be able to clock themselves in.

Clocking in

Press **Clock In**. The screen says "*Ensure you are inside the clinic to securely clock in*" — and that is not just advice. Clocking in is **location-checked** against the geofence set in **Settings** → **Attendance**.

So it will not work from home, from the car park if your radius is tight, or with location switched off on the device. If clocking in fails while you are standing in the clinic, the radius is almost always too small.

Press it again at the end of your shift to clock out.

My Tracker

My Time Logs lists your own history — date, clock in, clock out, total time, status. New staff see *No records found* until their first shift. Above it, **Today · This Week · This Month · Custom Range** changes the period.

CHECK YOUR OWN HOURS BEFORE PAYDAY, NOT AFTER

A missed clock-out is far easier to sort out the same week than at the end of the month. The hours recorded here are what payroll is worked out from.

Team Overview

The **Team Overview** tab shows everyone's attendance rather than just yours. This one **is** gated: it needs the *Attendance admin* permission. Without it, a member of staff sees only their own record — which is the right default.

Reports

WHERE

Reports in the sidebar.

Set a **start and end date** at the top — every tab reads the same period. Each report has its own **PDF export**, and exporting is a separate permission from viewing.

Service Analysis

Income by service. Which treatments actually earn, how many of each you did, and what the doctor commissions on them came to. Shows **Total Services**, **Total Income**, **Commissions** and **Net Income**, with a full service breakdown table.

This is the report that tells you a treatment you do constantly is barely contributing, and one you do rarely is carrying the month.

Dentist Performance

One row per dentist: **procedures** done, **total income**, **lab fees**, **commission**, and **net to clinic**. Plus a procedure distribution and a full **Procedure Detail** table you can export separately.

Work with no dentist recorded is grouped as **Unassigned** — a large Unassigned figure means appointments are being booked without picking a dentist.

Patient Sources

Where your patients come from and what each channel is worth: **patients**, **services**, **total income**, **commissions** and **net income** per source, with an income distribution. Anyone with no source recorded appears as **Unknown / Walk-in**.

The sources themselves are the list you maintain in **Settings** → **Patient Sources**.

Marketing Funnel

The leads report — one row per channel: leads in, still in progress, lost, made it to the chair, the conversion rate, and the money those converted patients actually paid. Covered in detail in Part 9.

Clinic Overview

The whole business in one page: **Gross Income**, **Deductions**, **Total Expenses**, **Net Profit**, **Total Procedures**, **New Patients** versus **Returning Patients**, a patient distribution, **Top Procedures by Income**, and a full procedure table.

This is the one to export at the end of a month.

Lab tracking

Cases sent to an external lab can be tracked so nothing is lost between the impression and the fit. A **Lab Order** is raised from the patient's file, and **Lab Cases Received** alerts (switched on in **Settings** → **Alerts**) tell you when work comes back.

Lab tracking is its own module-access permission — without it the section does not appear.

Getting patients in

Leads, the public booking page, referrals, star ratings, and the Marketing Studio.

Leads — everyone who asked but has not booked

WHERE

Leads in the sidebar. **Admin only** — there is no permission switch for this page.

Someone calls asking how much a crown costs, says "I'll think about it", and hangs up. Written down here, that person gets followed up instead of vanishing.

What counts as a lead: anyone who asked but has not booked — a phone call about prices, a WhatsApp message from an ad, a friend of a patient who "might come". If they are standing at the desk booking, they are a patient; add them normally.

Adding one

Tap **Add lead**. Name and phone are the only must-haves.

FIELD	WHY IT MATTERS
Source	Meta ads, WhatsApp, Google, a friend. This one matters most — it is what the Marketing Funnel report counts, so pick it honestly every time.
Asked about...	Start typing and your own services list suggests itself.
Follow up on	The day they should be chased. Leads due today or overdue float to the top with an amber tag.
Branch	Only shows if your clinic has branches.

The labels on a card

Before you dial, the card tells you what the clinic already knows about this number.

already a patient (violet)	This person has a file with you. Click it to open their record.
asked before (orange)	The same number enquired earlier. Check the older lead first.
auto-replied (green)	The system already sent them a WhatsApp. Do not repeat it.
reply waiting to send (blue)	A message is written and sitting in <i>Messages</i> , waiting for someone to press send.
30+ days quiet (grey)	Nobody has touched this lead in a month. Chase it or mark it Lost.
due today / overdue (amber)	The follow-up date has arrived.

Working the list

Each lead is a card with three round buttons: open **WhatsApp**, dial the **phone**, or **convert to patient**. Tapping WhatsApp on a New lead marks it Contacted by itself.

The dropdown moves the lead through its stages: **New** → **Contacted** → **Booked** → **In the chair**, or **Lost**. Marking a lead Lost asks for the reason — "too expensive" said thirty times is a pricing decision waiting to happen.

The tabs filter by stage. **Active** (the default) hides won and lost leads so the list stays a to-do, not an archive.

Converting

Tap the convert button when a lead agrees to come in. The app first checks the phone number against your patients — if they already exist, the lead links to them instead of creating a twin file. If not, a patient file is created carrying the lead's source, so the channel keeps its credit forever.

Answering automatically

Switch on **Settings** → **WhatsApp** → **Lead auto-reply** and every new lead from Facebook gets a WhatsApp within seconds. You choose how it goes out:

- **Automatic** — the system sends it unattended, day or night.
- **By hand** — the message is written and waits in *Messages* for someone to press send.

Either way each person is messaged once, never twice, and never at all if the lead has no phone number. Rewrite the wording under the template "*Instant reply to a new lead*".

The Marketing Funnel report

WHERE

Reports → **Marketing Funnel**

One row per channel: leads in, still in progress, lost, made it to the chair, the conversion rate — and the money those converted patients actually paid. A channel only gets revenue credit for money traceable to a recorded lead, so ads cannot claim credit for walk-ins.

- **Click a channel row** with a "1 campaign" chip and it opens up, showing each ad campaign separately. This is where you see that one campaign brought ten leads and no patients while another brought three

leads and two patients.

- **Avg. time to reply** — how long, on average, between a lead arriving and anyone touching it. Green under an hour. This is the number that decides whether ad money is wasted.
- **returning** — money from patients the clinic already had. It sits apart from the main revenue figure, because a channel deserves credit for the patients it *brought*.
- **stale** — leads untouched for over a month, shown separately so "in progress" means genuinely in progress.

That last column is the number to put next to what each channel costs you. A channel bringing ten leads and no chairs is noise; one bringing three leads and two chairs is where the budget should go.

HABITS THAT MAKE IT WORK

Write the lead down **during** the call, not after — two fields, ten seconds. Always set a follow-up date; a lead without one belongs to nobody. Be honest with **Lost** and its reason, because the report is only as truthful as the stages are.

The public booking page

WHERE

Switch it on in **Settings** → **Online Booking** and copy the link. Put it in your Instagram bio, your Google profile, and your ads.

This is the only screen in the system a patient ever sees. It shows your clinic name and lets someone request an appointment in a few steps:

- 1 Pick a **branch**, if you have more than one.
- 2 Pick a **date**. Days you are closed are shown as closed.
- 3 Pick a **time** from the free slots — these are read live from your real calendar and your working hours.
- 4 Pick a **doctor**, if you allow doctor selection.
- 5 Enter **name**, **phone** and the **reason for the visit**, and submit.

The request lands in your system and the patient sees a confirmation. Bookings arriving this way are tagged with the source **Online Booking**, and if you add `?src=meta` or `?src=google` to the link you share, that channel is credited automatically without anyone typing anything.

WHAT THE PAGE DELIBERATELY DOES NOT DO

It does not show a patient their own records or their balance. An earlier version asked for a phone number and then displayed that person's history — a phone number is not a password, and health data is sensitive personal data under Egyptian Law 151/2020. Until a proper identity check exists, the page does the one thing it can do safely: take a booking request.

Referrals — patients bringing friends

Each patient has a **referral link and QR card**. When a friend opens it they see your clinic's name, who sent them, and two fields: name and phone.

The friend becomes a **lead in your inbox tagged with who sent them**, and reception calls back. The page is Arabic-first with an English echo, and is protected against automated spam.

This is how word of mouth becomes something you can actually count — the Marketing Funnel shows referrals as a channel like any other.

Star ratings and Google reviews

After a visit you can send the patient a WhatsApp link to a one-question page: **five stars**.

4 or 5 stars	The patient is forwarded to your Google review page — the link from your clinic profile — while they are still feeling good about the visit.
1 to 3 stars	A private " <i>tell us what went wrong</i> " box opens instead. That feedback reaches the clinic manager only, and never Google.

Each request can only be answered once. This is the single highest-return marketing habit in the system: it raises your public rating and catches unhappy patients privately, before they post.

Marketing Studio

ADD-ON

WHERE

Marketing in the sidebar. Sold as a separate add-on — it is not included in any plan by default.

Ready content, a posting calendar, and monthly plans. Eight tabs.

Clinic voice — do this first

Before anything sounds like you, fill in the **clinic voice**: how you talk to your audience, your **default tone** (Friendly & warm, Professional & calm, Premium & elegant, or Light & playful), your **default content language** (Egyptian Arabic or English), whether **prices** appear in your posts, whether your **phone** appears on designs, and your logo. Every design comes out in this identity automatically.

Until it is filled in, the studio keeps telling you to *complete the clinic voice setup so content sounds like you*.

Create

- 1 Choose the **content type**: **Post**, **Reel** or **Ad**.
- 2 Choose the **language** and **tone** (they default to your clinic voice).
- 3 Add anything to emphasise.
- 4 Generate. A reel comes back with a **filming script** as well as the caption.

Each generation costs **1 credit** from your monthly marketing quota; a whole month's plan costs 5.

The other tabs

TAB	WHAT IT IS FOR
Campaigns	Message a whole group of patients at once. Segments: dormant patients, patients with unfinished treatment , and birthdays . Write the campaign message, launch, and the messages are prepared for sending.
Cases	Before-and-after case material. The studio flags patients who are a <i>perfect candidate for a video review reel</i> .
Reviews	The star-rating requests and what came back.
Results	Leads and spend for the month, and cost per patient . Empty until you record spend.
Calendar	What is scheduled to post, day by day. Set a posting date and how many posts per week you are aiming for.
Library	Everything generated, kept. Each item is Draft , Scheduled or Posted . Click to edit; delete is permanent.
Playbooks	Whole-month plans, generated in one go.

The playbooks

Balanced month	A healthy mix for any month: education, trust, light engagement, and one soft offer.
New clinic opening	Introduces the clinic, the doctors and the services — built to turn strangers into first visits.
Ramadan plan	Ramadan-timed content: greetings, fasting-friendly dental tips, and an offer for after-Iftar hours.
Slow season recovery	For quiet weeks: why check-ups matter now, plus a time-limited offer to fill chairs.
Push one service	A focused month around one service you pick — education, proof, objections, then the offer.

Channels supported: **Facebook**, **Instagram** and **Google Business**.

10

Talking to patients

WhatsApp, the messages queue, text messages from the clinic phone, and owner alerts.

WhatsApp

PREMIUM

WHERE

Settings → WhatsApp · Admin only

Connecting

The connection needs two values from your Wapilot dashboard:

- 1 Enter the **Instance ID**.
- 2 Paste the **API token**. Leave the token box blank when editing later to keep the current one.
- 3 Save. Until both are in, the panel says **Not configured**.

There is a **test** action to confirm the connection works before you rely on it.

How messages are sent

One switch decides everything about how the clinic behaves:

Automatic	The system sends unattended, day or night.
Open WhatsApp to send	The system writes the message and puts it in the Messages queue for a person to press send.

Above that is the master switch, **Enable automated patient messages**. Turn it off and nothing goes out at all.

The messages you can send

Each has its own template you can rewrite:

TEMPLATE	SENT WHEN
New appointment	A booking is made.
Appointment moved	The date, time or doctor changes.
Cancel appointment	An appointment is cancelled.
Invoice / ledger line	A payment is received.
Treatment update	A procedure is recorded.
Google review request	You ask a patient to rate you.
Reactivation	A lapsed patient is invited back.
Instant reply to a new lead	A lead arrives from a Facebook ad.

Writing a template

Templates are plain text with placeholders in double braces. The system fills them in per patient. Available placeholders:

{{patient_name}}	{{clinic_name}}	{{doctor}}
{{date}}	{{time}}	{{procedure}}
{{amount}}	{{balance}}	{{method}}
{{description}}	{{notes}}	{{tooth}}
{{google_link}}	Your Google review link from the clinic profile.	

The supplied templates are bilingual — Arabic and English in the same message — which is the safe default when you do not know which language a patient reads. Each can be reset to default.

Lead auto-reply

Answer every new lead from Facebook ads automatically. Switch it on and each new lead gets a WhatsApp within seconds, either sent automatically or queued for a person. Each lead is messaged once, never twice, and never if they have no phone number.

Owner alerts

Set an **Owner WhatsApp number** and choose the **alert rules** — the events important enough to reach the owner's own phone rather than sit in the system.

Messages — the queue waiting to be sent

WHERE

Messages in the sidebar.

WhatsApp does not let any outside program send messages on a clinic's behalf. So the system does the part it can: it decides **who** to message and writes **what** to say. A person still presses send.

Sending one

- 1 Click the green **Send** button on a message.
- 2 WhatsApp opens — WhatsApp Web on a computer, the app on a phone — with the whole message already typed in the right chat.
- 3 You press send in WhatsApp. Nothing to type, nothing to copy.

The message then disappears from the list by itself, so nobody sends it twice.

What lands here

- **New lead replies** — when the clinic chose to answer by hand rather than automatically.
- **Appointment reminders** — the nightly job prepares tomorrow's reminders while nobody is at a screen.
- Anything else switched on in **Settings** → **WhatsApp**.

The other buttons

Dismiss removes a message without sending it — for ones you decide against, or already handled by phone.

Sent (top right) shows what has gone out recently.

WHY MESSAGES DISAPPEAR ON THEIR OWN

A message older than three days is dropped. A reminder about "your appointment tomorrow" is worse than useless once tomorrow has passed — better to say nothing than to confuse a patient.

If the list is always empty

That is normal for a clinic that sends automatically. Two reasons a message would appear here: delivery is set to **manual**, or delivery is automatic but the WhatsApp connection failed — in which case the message drops into this list rather than being lost. If you expected automatic sending and things keep landing here, check the connection.

Text messages from the clinic phone

WHERE

Settings → **SMS** · Admin only

An alternative delivery route: messages go out as ordinary text messages from a paired Android phone with the Alpha app on it. It **reaches every patient, including those with no WhatsApp**.

READ THIS BEFORE TURNING IT ON

Every message is billed to the SIM. This is not free the way WhatsApp is. Carriers may also restrict a consumer SIM that sends a lot of similar messages. And the phone must stay on, in signal, and not be killed by battery saver.

Pairing a phone

- 1 In **Settings** → **SMS**, press to create a **pairing code**.
- 2 On the Android phone, open the Alpha app and enter the code. If you are already viewing this screen inside the Alpha app on that phone, you can pair it directly.
- 3 The phone appears under **Sending phones**, showing when it **last checked in**. A phone that stops checking in is shown as **Not checking in** — that is your warning it has been switched off or killed by battery saver.
- 4 To stop a phone sending, unpair it.

Choosing what goes out

How the clinic's messages reach the patient:

WhatsApp only	What happens today. No text messages are sent.
With the phone	Text messages are sent from the paired phone too.

Then pick which messages go out and what they say — **Booking confirmed** (the moment an appointment is booked), **Appointment moved**, **Appointment cancelled**, **Payment received**, and **Appointment reminder** (the day before, at the hour you set). Each has its own editable text and a reset to default.

DO NOT DOUBLE UP

Turning on the same message on both WhatsApp and SMS means the patient gets two messages about the same appointment — and you pay for the SMS.

Recent messages shows the queue and what has gone out. The queue is checked on a short cycle (as often as every 15 minutes).

Push notifications

Alerts reach phones as push notifications: a doctor calling reception, a lab case received, clinical alerts. Configure what is sent in **Settings** → **Alerts**. On the Android app, notifications arrive even when the app is closed.

Patients who do not want messages

Any patient can be opted out on their file — separately for WhatsApp and for text messages. Once set, no automatic reminder or campaign reaches them, and the Recover Payments list marks them **Opted out of messages** so nobody chases them by message either.

11

Alpha — the AI assistant

The chat bubble, the five scans that run on their own, and what all of it costs.

TWO DIFFERENT THINGS

The assistant is reactive: you ask, it answers. It is on the free trial, Pro and Premium. **The proactive scans** — Revenue Recovery, Reactivation, Operations, Attendance — run on their own initiative and are **Premium only**.

The chat bubble

WHERE

The bubble in the corner of every screen. Titled **Alpha AI**.

Type a question in plain English or Arabic — "Ask Gemini anything...". It reads your clinic's own records to answer, so the numbers it gives are yours, not estimates.

What you can ask it to do

KIND OF REQUEST	EXAMPLES
Look things up	Find a patient, read the ledger, check who owes money, look up a clinical record.
Explain the numbers	Run a clinic report, produce a financial summary, compare a period.
Make documents	Generate a PDF — a financial report, or the appointment book for a period, grouped by day with a count and the status spelled out.
Run the day	Open an appointment, set its status, reschedule it, suggest free slots.
Take money	Record a payment against a patient.
Message a patient	Send a patient WhatsApp, or trigger an appointment message.
Chart	Update the odontogram from what you tell it, using the real diagnosis catalog.
Housekeeping	Find duplicate ledger entries, navigate you to the right screen, remember a fact you tell it.

NOTHING RISKY HAPPENS WITHOUT YOU APPROVING IT

Anything that touches money, a patient's phone, the calendar or a deletion is **staged, not done**. You get a confirmation card showing the real record — read fresh from the database, not from what the model claimed — with a field-by-field before-and-after. It only happens when you approve it. A staged action expires after **10 minutes**, because a stale prompt should not stay actionable.

Talking to her

The assistant answers to the name **Alpha**. Say it out loud and whatever follows is taken as the command — "Alpha, check him in". Speech recognition rarely spells a name the same way twice, so several pronunciations are accepted, in Arabic as well as English.

A KNOWN COST OF THE NAME

"Alpha" is also the system's own brand and an ordinary English word. Staff saying "in the Alpha system" or "the alpha version of the form" will summon her. That is a real consequence of the name, not a fault in the listening.

Other controls

Clear Chat starts a fresh conversation. If you see *"AI feature requires Pro or Premium tier"* or *"Monthly AI credit limit reached"*, see the credits section below.

Daily Briefing

WHERE

Briefing in the sidebar. **Admin only** — no permission switch exists for it.

Today at a glance: today's schedule, the appointment count, who is cancelled, who is **not checked in**, and **balances with no recent activity**.

Every number here is read from your records — nothing is estimated. Read it once in the morning and you know what the day needs.

Revenue Recovery

PREMIUM

WHERE

AI → Revenue. Titled **Revenue Recovery**.

"Scans every financial and clinical record for money you earned but never collected." Press to scan; it reads the ledger and the clinical notes and groups what it finds.

FINDING	WHAT IT MEANS
Never invoiced	Treatment was recorded in the clinical notes but never reached the ledger. Work you did and never charged for.
Unpaid balance	The patient owes money and has gone quiet for over 45 days.
Duplicate entry	The same row was entered twice. A duplicated payment hides a real debt.
Below price list	Charged less than the price list says, without a recorded discount.

Switch between **All findings** and **Recoverable**. A category with nothing in it says so plainly. This is the single highest-value scan in the system — most clinics find real money the first time they run it.

Patient Reactivation

PREMIUM

WHERE

AI → Reactivation

"Finds patients who have not been in for a while. **Nothing is sent until you approve it.**"

Two buttons: **Scan only** lists who has lapsed; **Scan & draft messages** also writes a message for each one. The threshold used is the reactivation setting from **Settings** → **Recall**, and it is shown so you know what "lapsed" meant on this run.

Patients are grouped as **Patients not seen in [period]**, **Registered but never seen**, and **Already returning** (so you do not chase someone who is already coming back).

Each draft sits **waiting for your review**. Approve it and it goes to the Messages queue to be sent; dismiss it and it disappears. You can edit a draft before approving.

Operations — Recalls & Stock

PREMIUM

WHERE

AI → Operations

"Patients due for a check-up, and supplies running low" — two lists in one place.

- **Due for check-up** — driven by the recall interval in **Settings** → **Recall**. If no interval is set the page says *No recall interval set* with a **Set it now** link.
- **Running low** — items below their reorder threshold. Says *Nothing is running low* when the cupboard is fine, and *No inventory items recorded yet* if you have not started.

WHERE

AI → **Attendance** in the sidebar. **Admin only.**

This is not staff attendance — it is **patient** attendance. It looks over **past appointments** that were never closed out and asks you to say what actually happened.

Each one **needs an answer**: did they come, or was it a **no-show**? Answering closes it out and the appointment stops polluting your figures. When there is nothing left it says *"Every past appointment is closed out."*

It also reports how many patients have enough history for the pattern to mean something, and how many no-shows are recorded.

WHY BOTHER

An appointment left at "Confirmed" three weeks after the fact is neither attended nor missed. Left alone, your no-show rate, your dentist utilisation and your revenue reports are all quietly wrong.

AI inside the clinical screens

- **AI Treatment Plan Suggestions** — drafts the steps of a plan from what is charted. You edit anything it proposes.
- **AI Diagnosis Discussion** — a saved conversation about one patient's findings, on their Treatment Plan tab.
- **Plan translation** — turns a treatment plan into the patient's language.
- **Dictated clinical notes** — spoken notes transcribed and structured into records. Premium only.
- **Reception assistant** — an alternative appointment panel that answers in plain language instead of showing fields. Switch it on in **Settings** → **Interface**.

Credits — what the AI costs

WHERE

Settings → **AI Credits** · Admin only

PLAN	CREDITS PER MONTH
Free Trial	200
Basic	0 — no AI
Pro	1,000
Premium	2,000

The page shows what is left and a **breakdown by feature**: AI Assistant chat, Reception assistant, Diagnosis discussion, Treatment plan suggestions, Plan translation, Marketing content.

Credits reset on the 1st of every month and do not roll over. Marketing generations are metered separately — 1 credit for a single piece, 5 for a whole month's plan.

When the allowance runs out the assistant says "*Monthly AI credit limit reached*" and stops until the 1st, or until an Admin is given extra credits.

A WORD ABOUT TRUSTING IT

The assistant reads your real records, and everything risky waits for your approval. But it is still software reading data that people typed. Check anything that would be expensive to get wrong — a payment amount, a deletion, a message about to reach a patient — before you approve it. The confirmation card exists precisely so you can.

The Android app, and admin tools

The phone app, the maintenance tools, and the operator's panel behind the whole product.

The Android app

A native phone app that talks to the same live data as the web app. Sign in with your **email and password** — the same login you use on the web.

What is on it

Home & Day	Today's schedule, the clock-in card, and the day's flow.
Patients	The patient list and each patient's file.
Appointments	Booking and appointment sheets.
Money	The ledger, ledger detail, payments.
Clinical	Teeth chart, diagnosis chart, notes, prescriptions.
Ortho	Orthodontic cases.
Inventory	Stock.
Leads	The lead inbox.
Reports	The reports, and PDF documents.
Assistant	Alpha, including asking her for a PDF of the finances or the appointment book.
WhatsApp queue	The messages waiting to be sent.
SMS sender	If this phone is the paired sending phone.

Push notifications arrive even when the app is closed. The app is **online-only** — it needs a connection to work; there is no offline mode.

Data repair

ADMIN

WHERE

Settings → the Database Repair Bot

Press **Run Repair Bot**. It crawls your clinic's data looking for records that have drifted out of shape — a payment with no procedure attached, a staff record missing its link, that kind of thing — and repairs what it safely can.

Run it when something looks wrong that you cannot explain, or when support asks you to. It is safe to run more than once.

The migration tool

ADMIN

WHERE

/migrate

A one-off tool for clinics that were using an older version of the system. It walks every appointment and fills in the **Reason for Visit** where it is missing, taking it from the services attached to the appointment.

Press **Run Migration** and watch the log. It reports each appointment it changes and finishes with a count.

YOU ALMOST CERTAINLY DO NOT NEED THIS

If your clinic was set up recently, there is nothing to migrate — running it will simply report zero changes.

The superadmin panel

WHERE

/superadmin — the product operator only, not clinic Admins.

The panel that manages every clinic on the platform. Search by **name, ID, or owner email**, then:

- **View Details** — the clinic and its owner.
- Change its **subscription tier** — Free Trial, Basic, Pro, Premium.
- Change its **status** — Active, Suspended, Expired.
- Switch individual **features** on or off for that clinic, outside its plan. This is how the Marketing add-on is granted, and how extra AI credits are given.
- **Open Clinic in New Tab**, update the owner's user record, or **Delete Clinic**.

If a clinic Admin reports having a feature their plan should not include — or missing one it should — this override is usually the explanation.

Where your data lives

Everything is stored per clinic and is invisible to every other clinic on the platform. Access is enforced on the server, not just hidden in the interface — so a page someone cannot see is also a page whose data they cannot read.

Patient records are health data. Under Egyptian Law 151/2020 that is sensitive personal data, which is why the public booking page will not show a patient their own history from a phone number alone, and why deletions are permission-gated rather than available to everyone.

13

When something is wrong

The questions people actually ask, with the answer next to them.

Access and menus

" ... "	THE ANSWER
A screen in this manual is not in my menu	Either your plan does not include it (Inventory, Attendance and WhatsApp are the common ones), or you do not have the permission. Ask your Admin.
A new staff member sees almost nothing	Expected. Anyone approved through a join request starts as an Assistant with no permissions. Set their role and switches in Manage Access .
It says <i>0 of 26</i> but they can see Patients and Appointments	Built-in permissions that are not shown as switches. Nothing is wrong.
I turned on Settings and they still cannot open it	There are two Settings switches — the sidebar link and the full page. Turn on both.
They still cannot see Briefing / Leads / AI Attendance	Those three are Admin-only and have no switch. The only way is to make them an Admin.
I changed their permissions and nothing happened	Ask them to refresh. Changes normally arrive instantly.

Patients and appointments

" ... "	THE ANSWER
<i>Phone must include country code first</i>	Pick a country in the selector and leave off the leading zero — 1001234567 , not 01001234567 .
It will not save a patient — duplicate phone	Tick the shared-number confirmation. If it is actually the same person, close the form and open their existing file instead.
The time I want is not in the dropdown	It is outside your opening hours. Settings → Schedule .
The dentist list is empty when booking	Nobody is marked as a dentist yet. Set the role, or switch on <i>Also works as dentist</i> for an Admin.
<i>Clinic closed this day</i>	A day off in your schedule. It asks rather than blocks — continue if you mean to.
Every appointment books as 30 minutes	Fill in Typical duration on your services.
Reports show a lot of Unassigned work	Appointments are being booked without picking a dentist.

Money

" ... "	THE ANSWER
<i>Payment amount cannot exceed the remaining balance</i>	Deliberate — it stops a treatment showing as overpaid. Use General Payment if they really are paying ahead.
Daily Income looks too low for how busy we were	It counts money received today, not work done. Unpaid treatment adds nothing.
A dentist says their commission is wrong	Almost always the lab fee coming off the first payment only. See Part 7 — the second instalment pays them more.
A treatment was done but the patient owes nothing	Add to Ledger was unticked at booking, or the procedure was added clinically and never billed. Run the Revenue Recovery scan.
I cannot download the finance report	Exporting is a separate permission from viewing.
Cannot remove a charge	"Cannot remove charge because payments exist. Delete payments first." Remove the payments, then the charge.

Messages

" ... "	THE ANSWER
Patients are not getting any messages	Check Enable automated patient messages is on, the WhatsApp connection is configured, and the patient is not opted out. Also check the phone number is in the right shape.
Messages keep piling up in the queue	Either delivery is set to manual — which is fine — or the WhatsApp connection is failing. Test it in Settings.
The queue is always empty	Normal for a clinic sending automatically.
A message vanished before we sent it	Anything older than three days is dropped, so a stale reminder never reaches a patient.
Patients get the same message twice	The same message is switched on for both WhatsApp and SMS.
Text messages stopped going out	The paired phone is Not checking in — switched off, out of signal, or killed by battery saver.

Attendance and AI

" ... "	THE ANSWER
Clocking in fails while standing in the clinic	The geofence radius is too small, or location is off on the device. Raise the radius in Settings → Attendance .
Someone forgot to clock out	Fix it the same week. The hours here are what payroll is worked out from.
<i>Monthly AI credit limit reached</i>	Credits reset on the 1st. An Admin can be granted extra.
<i>AI feature requires Pro or Premium tier</i>	The Basic plan has no AI at all.
<i>Session expired</i> on an AI page	Sign in again and re-run the scan.

Sign-in and setup

" ... "	THE ANSWER
<i>This is taking longer than usual</i> after creating a clinic	The clinic was created. Press Refresh page . Never press Create clinic twice.
<i>Staff Limit Reached</i>	Your plan's staff limit. Upgrade, or remove someone who has left.
A card says Broken Profile	Delete the card and add the person again. Their email can be reused.
I made a second clinic by mistake	Do not use it. Join the real one with its Clinic ID; ask support to remove the empty one.

Quick reference

Every screen in one table, the routines worth keeping, and where each function lives.

Every screen, and what it is for

SCREEN	WHAT IT IS FOR	WHO
Dashboard	Today: takings, appointment count and status, today's schedule with one-click stage buttons, clock-in nudge, New Patient, Quick Pay, Print Rx.	Everyone
Briefing	Today at a glance plus balances that have gone quiet.	Admin
Leads	Everyone who asked but has not booked, with follow-up dates and stages.	Admin
Marketing	Content, campaigns, cases, reviews, results, calendar, library, playbooks.	Add-on
Messages	WhatsApp messages the system wrote, waiting for someone to press send.	Permission
Patients	The patient directory; search by name or phone.	Permission
Patient file	Clinical · Treatment Plan · Finance · Timeline · Overview · X-Rays & Photos · Prescriptions · Notes.	Permission
Appointments	The calendar in Week, Day, Doctors or List view. Booking, rescheduling, stages.	Permission
Dental Diagnoses	The odontogram — charting findings tooth by tooth, plus perio, plus a PDF report.	Clinical
Prescription Studio	Write, save, print or WhatsApp a prescription.	Clinical
Ortho	Orthodontic cases, visit by visit.	Ortho
Inventory	Stock, value, low-stock warnings, CSV export.	Pro+
Finance	True Net, cash in, deductions, expenses, transactions, PDF report.	Permission
Recover Payments	Everyone who owes money, largest first, with follow-up states.	Permission
Reports	Service Analysis · Dentist Performance · Patient Sources · Marketing Funnel · Clinic Overview.	Permission
Attendance	Clock in and out; your own hours; the team's, with the admin permission.	Pro+

AI Revenue	Money earned but never collected.	Premium
AI Reactivation	Lapsed patients, with drafted messages awaiting approval.	Premium
AI Operations	Patients due for a check-up, and supplies running low.	Premium
AI Attendance	Past appointments never closed out — did they come or not?	Admin
Settings	Nineteen tabs; see Part 3.	Mostly Admin
Help	The built-in help articles, in English and Arabic.	Everyone
Public booking page	What patients see. Requesting an appointment.	Public
Referral page	A patient's friend leaves their name and number; becomes a tagged lead.	Public
Review page	Five stars. 4–5 goes to Google; 1–3 comes privately to the manager.	Public

Routines worth keeping

Every morning

- 1 Clock in.
- 2 Read the **Briefing** — or the dashboard if you are not an Admin.
- 3 Open **Leads** and work from the top: anything amber is due or overdue.
- 4 Clear the **Messages** queue.

Through the day

- 1 Mark every arrival **Check in** — it is what starts the waiting clock.
- 2 Tag the waiting mood when someone is in pain or anxious.
- 3 Take payments at the desk with **Quick Pay**, against the specific treatment where you can.
- 4 Move appointments to **Completed** as they finish. Mark real no-shows as **No show**.

Every week

- 1 Open **Inventory** → **Low** before phoning the supplier.
- 2 Check your own hours in **Attendance**.
- 3 Work the **Recover Payments** list from the top.

Every month

- 1 Export the **Clinic Overview** report.
- 2 Read the **Marketing Funnel** and compare each channel against what it costs you.
- 3 Run **AI Revenue Recovery** and **AI Attendance** to close out what was missed.

- 4 Record the month's expenses in Finance with **Manual Entry**.

The permission checklist for a new starter

- 1 Add them (**Add Team Member**) or approve their join request.
- 2 Open **Manage Access** and set the **role** first.
- 3 Switch on the **module access** for each page they need.
- 4 Switch on the **actions** they need inside those pages.
- 5 Leave **Delete** off until they have settled in.
- 6 If they need Settings, turn on **both** Settings switches.
- 7 Tell them to sign in and refresh if anything looks missing.

Ten things that are not bugs

- A short menu — it is the permissions, or the plan.
- *0 of 26* permissions while the person can still see two pages.
- Daily Income lower than the day felt — it counts cash received, not work done.
- A dentist earning less commission on the first instalment than the second.
- A time missing from the booking dropdown — it is outside opening hours.
- An empty Messages queue on a clinic that sends automatically.
- A message disappearing from the queue after three days.
- The clinic logo not appearing on printed receipts yet.
- The AI refusing to delete something until you press confirm.
- "Clinic closed this day" letting you book anyway — it asks, it does not block.

Where to get more help

The system carries its own help centre at **Help** in the sidebar — the same guidance as this manual, with screenshots, in English and Arabic, organised by section: Setting up your clinic, Front desk, Money, Clinical, Running the clinic, AI, Settings and Troubleshooting.

The activity log (**Settings** → **Activity Logs**) answers most "who changed this?" questions on its own, and marks whether an action was done by a person or by the assistant.
