

Alpha Dental System

Web Application — Complete Feature Inventory

Prepared for launch readiness review
15 modules · 160 documented features

10 August 2026

How to read this document. Every item below is a capability that exists in the web application today, described in terms of what it does for the clinic rather than how it is built. Tags on the right of a feature name show when it is restricted — by subscription plan (Pro, Premium), by role (Admin), or because it belongs to the platform owner rather than a clinic. Untagged features are available to every clinic on every plan.

This is an inventory of what is *present*. It is not a quality assessment, a test report, or a statement that each item is production-ready — those are separate exercises, and worth running against this list before launch.

Contents

01	Platform, Tenancy & Access Control	13 features
02	Bilingual Interface & Personalisation	5 features
03	Dashboard	9 features
04	Patients	12 features
05	Appointments & Scheduling	18 features
06	Clinical Records	14 features
07	Finance	12 features
08	Reports	7 features
09	Inventory	7 features
10	Staff Attendance, Payroll & Commission	11 features
11	Communications — WhatsApp	9 features
12	Communications — Alerts & Internal Signals	5 features
13	Alpha Intelligence (AI)	14 features
14	Settings	17 features
15	Security, Data & Operations	7 features

15 modules · 160 features documented

01 Platform, Tenancy & Access Control

Everything that decides who gets in, which clinic they see, and what they are allowed to do.

1.1 Multi-clinic (SaaS) tenancy

Every clinic is a separate tenant with its own patients, ledger, staff, settings and inventory stored under its own clinic space. No data is shared between clinics, and a user can belong to more than one clinic.

1.2 Email & password sign-in

Standard login screen backed by Firebase Authentication, with session handling and automatic redirect to login when the session expires.

1.3 Clinic onboarding

A new user either creates a clinic (which makes them its Admin) or requests to join an existing clinic by ID. Clinic creation runs server-side so the security rules can stay locked down.

1.4 Join requests & approvals

Requests to join a clinic land in a queue that an Admin reviews and approves or rejects from Settings.

1.5 Roles

Four roles: Admin, Dentist, Assistant and Receptionist. An Admin can additionally be flagged as a practising dentist so they appear in doctor pickers and appointment lists.

1.6 Granular permissions

Beyond roles, each staff member carries a permission list that controls both what appears in the navigation and what they can do on each screen (add appointments, view clinical data, view finance, and so on).

1.7 Subscription tiers

Four plans — Free Trial, Basic, Pro and Premium — each setting a staff-count ceiling, a monthly AI credit allowance and a set of unlocked modules. Individual features can also be switched on per clinic as an override.

1.8 Feature gating in the interface

Locked modules do not silently misbehave: they either disappear from the menu or show an explicit upgrade panel explaining what the plan does not include.

1.9 Super Admin control centre

Platform

A platform-owner area, separate from the clinic app, with three tabs: Clinics, Analytics and Users. It shows platform-wide KPIs, lists every clinic with its tier and days remaining, allows changing a clinic's plan and limits, and can open any clinic's dashboard for support.

1.10 Clinic switcher

Users attached to more than one clinic switch between them from the dashboard header without logging out.

1.11 Activity log

An audit trail of significant actions — settings changed, users created, records deleted — recorded with who did it and when.

1.12 Database repair tool

An Admin-run scan that relinks staff profiles to their login accounts by email and regenerates missing profile data, for records damaged by earlier imports or partial sign-ups.

1.13 Data migration screen

A one-off utility used to move legacy records into the current clinic-scoped data structure.

02 Bilingual Interface & Personalisation

The system is fully bilingual, not translated on top of an English layout.

2.1 English / Arabic with full RTL

A single toggle flips the entire application between English and Arabic, including the reading direction, the Arabic typeface, date and number formatting, and the wording of printed documents.

2.2 Theme settings

Appearance preferences saved per user.

2.3 Interface preferences

Each user chooses how the clinical procedure editor and the appointment booking form appear — as a pop-up window or as a side drawer — and whether the panel beside the schedule shows the appointment editor or the AI reception assistant.

2.4 Appointments visibility control

The appointments module can be hidden entirely, or restricted to desktop only, for clinics that do not want it on phones.

2.5 Toasts and confirmations

A consistent notification and confirm-before-you-act layer used across every screen, in both languages.

03 Dashboard

The landing screen, built separately for desktop and mobile rather than squeezed into one layout.

3.1 Desktop dashboard

Greeting with live date and time, today's income, today's appointment count, and a status breakdown (confirmed / unconfirmed / completed) alongside the day's schedule.

3.2 Mobile dashboard

A layout designed for phone use at the chair and at reception, with the same live data.

3.3 Today's schedule with inline actions

Appointments can be moved through their workflow stage, rated, edited, deleted, paid, receipted or prescribed straight from the dashboard row.

3.4 Weekly schedule view

A week-at-a-glance view of the clinic's bookings.

3.5 Quick actions

One-click New Patient and Quick Payment from the header.

3.6 Daily briefing card

Premium

A summary of the day computed directly from the records — appointments, and balances with no recent activity. It deliberately reports only what the data can support.

3.7 Personal clock widget

Pro+

Shows the signed-in staff member's own attendance state and lets them clock in or out without leaving the dashboard.

3.8 Notification bell

In-app alerts collected in one place.

3.9 Reception summon overlay

A full-screen call from a dentist reaches reception wherever they are in the app.

04 Patients

The patient record and everything attached to it.

4.1 Patient registry

Full list with tolerant search that matches partial names, out-of-order name parts and phone fragments, so a receptionist finds the right person from whatever the patient says.

4.2 New patient registration

Quick-add form available from anywhere in the app, including from inside the booking flow.

4.3 Patient profile with six tabs

Overview, Clinical, Timeline, Finance, X-rays and Prescriptions. Which tabs a user sees depends on their permissions.

4.4 Overview tab

Contact details, personal information, medical alerts, balance summary and a link straight through to the full ledger.

4.5 International phone handling

Numbers are stored in full international format with a country-code selector, so WhatsApp delivery and duplicate detection both work reliably.

4.6 WhatsApp opt-out

A per-patient switch that stops every automated message for that patient, respected by all sending paths.

4.7 CRM timeline

A chronological history of the relationship — bookings, contact attempts, lead status changes, completed treatment — combined with a log of every WhatsApp message sent to that patient and what it contained.

4.8 Media gallery

X-rays and clinical photographs uploaded against the patient, sorted into categories, viewable full-screen and removable.

4.9 Patient time tracker

Records how long the patient has actually been in the clinic during a visit.

4.10 Google review request

Premium

Sends the patient a review request over WhatsApp, logged against their record.

4.11 Patient sources

A configurable list of referral sources captured on the patient record and reported on later.

4.12 Delete patient

Permission-gated removal, written to the activity log.

05 Appointments & Scheduling

The booking calendar and the day-to-day flow of patients through the clinic.

5.1 Calendar grid

Time-slot schedule driven by the clinic's configured opening hours, slot length and days off, with navigation across days and weeks.

5.2 Drag-and-drop rescheduling

Move an appointment to a different time or day by dragging it; the record and its notifications follow.

5.3 Booking form as modal or drawer

The same booking and editing form, presented the way each user prefers.

5.4 Patient and slot pickers

Search-as-you-type patient selection, plus a slot picker that reflects real availability.

5.5 Treatment duration

Each treatment can carry its own expected length, so the calendar blocks the right amount of chair time instead of a fixed slot.

5.6 Nine workflow stages

Scheduled, Confirmed, Delayed, Cancelled, Checked In, In Chair, Checking Out, Completed and No Show — each with its own colour and label in both languages. Older records written with legacy status names are read correctly without a migration.

5.7 Check-in side effects

Marking a patient checked in stamps the arrival time and feeds the waiting-room and attendance views.

5.8 Late patient prompt

When a patient passes their appointment time, staff are prompted with four choices: check in anyway, keep waiting, cancel, or delay to a new time.

5.9 Waiting mood tracker

Reception records how the waiting patient actually seems — from happy to very upset — so the team can see pressure building in the waiting room.

5.10 Patient history drawer

Opens the patient's past visits and balance beside the calendar without navigating away.

5.11 Visit rating

A star rating captured against the completed appointment.

5.12 Filtering

Filter the schedule by dentist and by status.

5.13 Appointment side panel

Clicking an appointment opens a panel with the full editing form, the patient's ledger and a payment button.

5.14 Reception assistant panel

Premium

The same panel can instead show an AI assistant that answers questions about the patient and can check them in, reschedule, take a payment or message them — always on the user's confirmation.

5.15 Public online booking page

A public page per clinic where patients pick a date, time, dentist and reason and book themselves in, using the clinic's real availability.

5.16 Patient self-service records

On the same public page, a patient can look up their own appointments and outstanding balance using their phone number.

5.17 Online booking settings

Admins control whether the public page is live and what it offers.

5.18 Visit reasons

A configurable list of reasons shown to patients and staff when booking.

06 Clinical Records

What is diagnosed, what is done, and what is written down.

6.1 Clinical notes timeline

Every visit and procedure recorded against the patient in date order, with the treating dentist attached.

6.2 Service editor

Add and edit the services performed in a visit, with price, dentist, lab and notes — as a drawer or a modal, per user preference.

6.3 Transfer and continue treatment

A service can be moved to another visit, or continued across visits, so multi-appointment treatment stays as one thread rather than duplicate entries.

6.4 Odontogram (teeth chart)

Illustrated adult and paediatric charts with per-surface charting, so a diagnosis is recorded on the specific surface of the specific tooth rather than the tooth as a whole.

6.5 Diagnosis catalogue

A structured, categorised list of diagnoses and conditions, searchable and filterable, so charting stays consistent between dentists instead of relying on free text.

6.6 Periodontal charting

Pocket depth and periodontal readings entered per tooth and displayed as an overlay on the chart.

6.7 Diagnosis report PDF

Exports the full charted diagnosis, including the tooth chart itself, as a printable report.

6.8 Prescription studio

Build a prescription from a reusable drug database or by typing a custom drug, each with dose and instructions, signed by the selected dentist.

6.9 Prescription output

Print, download as PDF, or send the PDF directly to the patient over WhatsApp — all from the same screen.

6.10 Prescription history

Past prescriptions kept on the patient record, re-printable, with a finder for locating an earlier one.

6.11 Prescription letterhead

The clinic's header and details configured once in Settings and applied to every printed prescription.

6.12 Orthodontics module

A separate workspace for ortho cases: case list with status (Active, Completed, Retention), start date and elapsed time, a visit-by-visit table of work done and next steps, cephalometric fields (SNA, SNB, ANB, overjet, overbite, crowding, spacing, IMPA), diagnosis notes and printing.

6.13 Lab management

Each clinic keeps its own list of laboratories with their service prices and turnaround times, attached to procedures and used to calculate lab cost.

6.14 Lab orders over WhatsApp

Send a lab order to the laboratory directly from the case.

Premium

07 Finance

One ledger behind the whole system, rather than separate books per screen.

7.1 Unified ledger

Procedures, payments, expenses and other income all live in one ledger, so a treatment recorded clinically and the money collected against it are the same record seen from two sides.

7.2 Cash-basis KPIs

Cash in, expenses and net profit calculated on money actually moved, kept deliberately distinct from treatment-plan totals so the two are never confused.

7.3 Daily, monthly and custom range views

Switch the whole finance screen between a day, a month, or any date range.

7.4 Transactions

Add, edit and delete entries with amount, description, category, date, payment method and a recurring flag.

7.5 Filtering and paging

Filter by dentist and by patient, with tolerant patient search and paged results for large ledgers.

7.6 Discounts

A discount recorded on the line itself, so the difference between list price and what was charged stays visible.

7.7 Lab fee and doctor commission

Each procedure carries its lab cost and the treating dentist's commission, which resolves to the clinic's actual profit on that line.

7.8 Quick payment

Take a payment against a patient from the dashboard or the appointment panel without opening the finance screen.

7.9 Patient ledger and balance

Per-patient statement of everything charged and everything paid, with the running balance.

7.10 Receipts

Printable receipt for a payment, and the option to send the patient a receipt summary over WhatsApp.

7.11 Ledger PDF export

Export the filtered finance view as a formatted PDF.

7.12 Receivable-only lines

Treatment-plan lines with no cash collected are flagged as such, so planned work is never counted as revenue.

08 Reports

Four analytical reports over any date range, all exportable.

8.1 Date range control

Every report runs over a start and end date chosen by the user, defaulting to the current month.

8.2 Service analysis

Which treatments were performed, how often, and what they produced.

8.3 Dentist performance

Output per dentist across procedures and collections.

8.4 Patient sources

Where patients came from and what each source is worth.

8.5 Clinic overview

A combined view of activity, new patients and money over the period.

8.6 PDF export

Each report exports as a formatted, printable PDF with the clinic's identity on it.

8.7 Excel export

Report data exports to a spreadsheet for further analysis.

09 Inventory

Stock control for clinical materials.

9.1 Materials register

Each item with its current stock, minimum stock level, unit, and cost per unit.

Pro+

9.2 Categories and sub-categories

A two-level classification the clinic defines itself.

Pro+

9.3 Quick adjustments

Increase or decrease stock in one click as materials are used or received.

Pro+

9.4 Movement history

Every stock change recorded with the amount, the reason, the user and the time.

Pro+

9.5 Low-stock alerts

Items at or below their minimum are surfaced on the operations screen and can raise an in-app alert.

Pro+

9.6 Search, filter and paging

Tolerant search across a large materials list.

Pro+

9.7 CSV export

The stock list exports to a spreadsheet.

Pro+

10 Staff Attendance, Payroll & Commission

Working hours and what they are worth, recorded rather than remembered.

10.1	Geofenced clock in / out	Pro+
Staff clock in from their own device; the system checks their distance from the clinic against a configured latitude, longitude and radius and refuses a punch from outside it.		
10.2	Device binding	Pro+
An account is tied to the device it clocks in from, so one person cannot punch in for another. An Admin can unlink a device when a phone changes.		
10.3	Personal worksheet	Pro+
Each staff member sees their own hours, days and totals.		
10.4	Team overview	Pro+
Admins see the whole team's attendance across a date range.		
10.5	Per-day schedules	Pro+
Expected working hours defined per weekday per staff member, which is what late arrivals and overtime are measured against.		
10.6	Manual corrections	Pro+
An Admin can edit or delete a log entry when a punch was missed or wrong.		
10.7	Overtime approval	Pro+
Overtime is flagged and then explicitly approved or rejected, rather than accumulating silently.		
10.8	Payroll PDF	Pro+
Hours and pay for the period exported as a printable document.		
10.9	Commission calculation	Pro+
Dentist commission derived from the payments actually collected against their procedures, net of lab fees, with the percentage adjustable per entry.		
10.10	Commission PDF	Pro+
A per-dentist commission statement for the period.		
10.11	Attendance settings	Pro+
Clinic location, allowed radius and related rules configured by an Admin.		

11 Communications — WhatsApp

Patient messaging, templated and logged.

11.1	WhatsApp integration	Premium
	Connected through a configurable provider account, set up once by an Admin and tested from inside Settings.	
11.2	Message templates	Premium
	Editable bilingual templates for new booking, reschedule, cancellation, payment received, treatment update, review request and reactivation.	
11.3	Variable merging	Premium
	Templates fill in patient name, dentist, date, time, amount and clinic details automatically, in the patient's language.	
11.4	Automated 24-hour reminders	Premium
	A scheduled job runs every morning and sends each of tomorrow's patients their reminder, using the clinic's own template and time zone.	
11.5	Documents over WhatsApp	Premium
	Prescription PDFs, receipts, lab orders and review requests sent as messages from the screen where they were created.	
11.6	Owner alerts	Premium
	Selected events pushed to the clinic owner's own WhatsApp.	
11.7	Inbound webhook	Premium
	Incoming WhatsApp events are received and processed.	
11.8	Full send log	Premium
	Every message sent to a patient — type, content and time — recorded on the patient's timeline.	
11.9	Opt-out enforcement	Premium
	A patient who has opted out is skipped by every automated path, not just the manual ones.	

12 Communications — Alerts & Internal Signals

Getting the right person's attention inside the clinic.

12.1	Push notifications
	Browser and mobile push through Firebase Cloud Messaging, with per-device token registration and a service worker for messages received while the app is closed.
12.2	In-app clinical alerts
	Configurable alerts for patient arrival in the waiting area, lab cases received, low inventory and the daily revenue summary.
12.3	Email report preferences
	A management email address set for daily and weekly summaries.

12.4 Reception summon

A dentist calls reception from the chair; the request appears as a full-screen overlay on the reception device, with sound, and is acknowledged.

12.5 Notification centre

All in-app notifications gathered under one bell in the header.

13 Alpha Intelligence (AI)

AI features are separated into a reactive assistant, proactive scans, and voice. Each is gated independently.

13.1 AI chat assistant

Free Trial / Pro / Premium

A chat bubble available anywhere in the app that answers questions about the clinic's own data — patients, appointments, money — and can act on it.

13.2 Assistant capabilities

Free Trial / Pro / Premium

Roughly twenty tools, including: fuzzy patient lookup; reading and writing records; accurate financial summaries for a date range; clinic reports broken down by dentist or service; appointment slot suggestions that respect the schedule and treatment length; opening, rescheduling and changing the status of an appointment; recording a payment; updating the odontogram against the diagnosis catalogue; sending a templated WhatsApp message; generating a PDF; navigating the user to a screen; and finding duplicate ledger entries.

13.3 Confirmation gate

Free Trial / Pro / Premium

Anything the assistant proposes that changes data or contacts a patient is held as a pending action and executed only after a human approves it.

13.4 Long-term memory

Free Trial / Pro / Premium

The assistant can be told a clinic policy or corrected on a fact, and remembers it for future conversations.

13.5 Credit metering

AI usage is counted against a monthly allowance set by the plan, with per-clinic top-ups possible.

13.6 Daily briefing

Premium

The day summarised from the records — today's appointments and balances that have gone quiet. It states plainly what it cannot yet report rather than inventing it.

13.7 Revenue recovery scan

Premium · Admin only

Audits the ledger for money that has gone missing in four specific ways: treatment recorded clinically but never invoiced, unpaid balances where the patient has gone quiet, duplicated entries that hide a real debt, and procedures charged below the price list. Each finding links straight to the patient's ledger.

13.8 Patient reactivation scan

Premium · Admin only

Finds patients who have lapsed past the clinic's own dormancy threshold, and can draft a personalised message for each one. Drafts sit in a review queue where staff edit, approve or reject them before anything is sent.

13.9	Recalls and stock	Premium
	Patients due for a routine check-up, and supplies running low, on one operations screen. Both state clearly when the underlying setting has not been configured, instead of showing an empty list that would read as good news.	
13.10	Unresolved appointments	Premium
	Past appointments never marked as completed or missed are listed for one-click resolution, which is what makes the no-show data trustworthy.	
13.11	No-show risk	Premium
	Patients scored into risk bands from their own attendance history, with an explicit 'not enough data' band rather than a false reassurance.	
13.12	Treatment plan generation	Premium
	AI-assisted drafting of a treatment plan from the clinical picture.	
13.13	Voice replies (text-to-speech)	Premium
	Assistant replies spoken aloud, generated on the server so every clinic machine sounds the same and Arabic actually works. Speech is only produced when switched on, every character is metered against a monthly ceiling, repeated phrases are cached, and long replies are refused rather than half-spoken.	
13.14	Reception avatar assistant	Premium
	An animated reception assistant beside the appointment schedule that can be asked about the patient and can act on their appointment, on confirmation.	

14 Settings

Seventeen configuration areas, grouped as Personal, Clinic Management, and System & Automation.

14.1	Profile	
	The signed-in user's own name, contact details and password.	
14.2	Theme	
	Personal appearance preferences.	
14.3	Interface	
	How editors and panels are presented for this user.	
14.4	Clinic profile	Admin
	Clinic name, doctor name, phone, address, email, currency and letterhead.	
14.5	Users	Admin
	Create staff logins, assign roles, set granular permissions, and mark an Admin as a practising dentist.	
14.6	Join requests	Admin
	Approve or reject people asking to join the clinic.	

14.7	Schedule	Admin
	Opening and closing time, slot length and days off — the basis for the calendar and for availability.	
14.8	Prices	Admin
	The clinic's service price list, used for billing and for the below-price-list audit.	
14.9	Prescriptions	
	Prescription letterhead and the reusable drug list.	
14.10	Recall	Admin
	How long after a visit a patient becomes due for a check-up.	
14.11	Patient sources	Admin
	The referral sources offered when registering a patient.	
14.12	Visit reasons	Admin
	The reasons offered when booking, including on the public page.	
14.13	Attendance	Admin
	Clinic coordinates, allowed radius and attendance rules.	
14.14	Online booking	Admin
	Whether the public booking page is live and what it exposes.	
14.15	WhatsApp	Admin · Premium
	Provider credentials, templates, dialling countries and a live test.	
14.16	Alerts	Admin
	Which events raise in-app alerts and which email summaries are sent.	
14.17	Activity logs	Admin
	The audit trail of what changed and who changed it.	

15 Security, Data & Operations

The parts that are not screens but decide whether the rest can be trusted.

15.1	Clinic-scoped data access	
	All patient, ledger, staff and inventory data sits under the clinic that owns it, and database rules — not just the interface — enforce that boundary.	
15.2	Server-side privileged actions	
	Creating clinics, creating staff logins, resetting passwords, deleting users and running scans happen on the server with an authenticated staff check, so they cannot be triggered by a modified browser.	
15.3	Permission guards on screens	
	Individual pages and controls check permission before rendering, in addition to being hidden from the menu.	

15.4 Read-only mode

A clinic can be placed in a state where data can be viewed but not changed.

15.5 Scheduled job authentication

The daily reminder job authenticates with a shared secret, so the endpoint cannot be triggered by anyone who finds the URL.

15.6 Storage for clinical media

X-rays and photographs stored in Firebase Storage against the patient.

15.7 Deployment

Next.js 16 with React 19 on Vercel, Firebase Authentication, Firestore and Storage as the backend, with the daily automation running as a scheduled Vercel job at 07:00.
